Other varieties specified in tariff law.—Letter, note, record, tablet, and typewriter papers, as specified in the tariff, are merely subdivisions of the kinds discussed above, classified according to use. Often it is merely the size or the form in which the paper is cut for a particular purpose that determines its tariff classification. Tablet paper is often of material inferior to that used in the other grades named. Drawing paper is a high-grade product made chiefly of rags. In England esparto is much used for drawing paper. Handmade papers, when imported, are usually extra fine and fancy papeteries or special stationery. Japan paper is a paper of a pronounced silky texture, formerly made exclusively from the bark of the mulberry tree, beat out by the Japanese with mallets. Now, however, it is made also of other vegetable fibers. It is used principally for writing, printing, tapestry, imitation Japanese wall hangings, and to some extent in art-craft books. Onionskin paper is a very thin paper, made principally of rags. It is almost transparent, and has a highly glazed surface and a texture almost like the skin of an onion.

Bristol boards.—Bristol boards, because of their classification with cardboard in the tariff act of 1913, and because of their greater thickness compared with other kinds of paper, have been discussed in another Tariff Information Survey.[1] Nevertheless, one kind of Bristol board is really a high grade of writing paper. Bristol board of this type is sometimes made of two or more sheets of fine paper pasted together after they come off the Fourdrinier machine. Some so-called index Bristol board, for use in card-index systems, is made as a single sheet on a Fourdrinier machine. In the opinion of the Bureau of Standards only this kind is entitled to the name Bristol board. In many cases it is impossible to distinguish such a Bristol board from heavy ledger paper, although the fiber used in ledger paper is supposed to be longer, with the result that ledger paper held against the light should appear mottled, while Bristol board should have a uniform appearance. In practice often even this distinction does not exist. In fact, some Bristol board is called index ledger Bristol. Consequently the Tariff Commission recommended that Bristol board of this kind (both pasted and single ply) be separately denominated as "solid Bristol board made on a Fourdrinier machine."

Another type of Bristol board of inferior material is made on a multicylinder machine called filled Bristol. One of the principal varieties of this type is known as bogus Bristol. The method of

[1] See Tariff Information Survey, Building Paper, Paper Board, and Filter Masse.

production and tariff classification of cylinder-machine-made Bristol are discussed in the survey on paper boards.

Tariff interpretation of handmade papers.—It is to be noted that the papers classified under paragraph 326 of the act of 1913 include certain varieties which, if admitted according to the use specified for them, would fall under a different classification. These are copying, printing, tissue, and bibulous papers that are handmade. Handmade papers of all kinds are dutiable under paragraph 326 instead of under the paragraphs classifying them according to use or texture. (See G. A. 7979, T. D. 36767; Abstract 43915; 2 Ct. Cust. Appls., 237; G. A. 8168, T. D. 37623.)

Envelopes.—The envelopes treated in this discussion, and admitted under paragraph 327, are made of a considerably greater variety of materials than those named in paragraph 326, although the latter form one of the most important groups of constituents of envelopes. Envelopes made of surface coated, parchment, and similar papers, however, are dutiable under paragraph 324 and are discussed in another survey.

Kraft paper (made of sulphate wood pulp) forms the basis for a considerable class of envelopes. These are ordinarily large, strong envelopes and are used mainly for mailing circulars, photographs, pamphlets, and catalogues. Manila envelopes constitute an important class. These are also usually large and strong. They are much used for filing-cabinet purposes and, like kraft envelopes, for mailing circulars. A great many manila and kraft envelopes are made in all sizes with metal clasps for wrapping and for mailing a great variety of small articles. A huge number of envelopes are made to carry the business correspondence of the country and advertising matter of light weight. The great preponderance of these are made of wood pulp, principally sulphite. The stamped envelopes sold at post offices are of this type. Oftentimes the envelopes used by business concerns are of inferior material to the correspondence sheets they contain. The best grade of envelopes (other than ornamental specialties) are those made to be used with fine stationery for social correspondence. These are ordinarily made of the same kind of paper as the paper they contain, and thus may range in content from all sulphite to all new rag.

DOMESTIC PRODUCTION.

Comparison with other kinds of paper.—Fine paper ranks sixth in tonnage among the varieties of paper made in America, being exceeded by paper boards, newsprint, book paper, wrapping paper, and building paper. In 1921 the tonnage of fine paper produced amounted almost to that of building paper, the next higher in scale of production. In value, however, fine paper compares favorably with these other grades. In 1919 it was fifth, but was only slightly less than that of newsprint and that of wrapping paper.

Raw materials.—The principal raw materials of the fine-paper industry are cotton and linen rags. As noted above, chemical wood pulp is much used in the cheaper grades of writing paper. In England esparto grass is used to a considerable extent in making medium quality writing paper, although its principal use is in the manufacture of a high-class, soft-textured book paper for lithographic

and art illustration. Esparto grass grows wild in Spain
hern Africa, the better grade coming from Spain. It is
d compressed and shipped in large amounts to England.
ıantities of other fibers are used in the manufacture of
per.

lary materials are rosin, alum, dyes, china clay, agalite,
ıal glue. Rosin is used for sizing purposes, that the finished
ay take ink without blotting. Alum is used to precipitate
ı and any coloring materials which may be used. Filler is
tle used in the fine-paper industry. Agalite and English
ay are the most common fillers for writing paper. Agalite
heaper of the two. Glue made from animal hides is much
r sizing fine paper after it has been made on the paper
e. Rags and chemical wood pulp and English china clay
only ones of these materials that are imported. Obtaining
ers presents no difficulty and no tariff problem; the amounts
'e comparatively small.

ı: Rags are obtained both in the United States and from
. They are admitted free of duty. Both new cotton and
ːuttings and old rags are imported. New rag cuttings are
ɔrincipally by the mills making the finest grades of paper.
are a number of mills in Dalton, Mass., for instance, which
ɔ wood pulp and no old rags whatsoever. The development
; the war of special processes such as the making of photo-
ic paper, the hydrating process, and the celluloid process,
ısed the demand for high-grade new rag cutting. Before the war
'ts averaged annually more than 100,000 tons (not including
ːn rags), most of which came from France, Germany, the
ːd Kingdom, Holland, Belgium, and Canada. During the war
imports steadily declined, until in the calendar year 1918 they
ınted to less than 2,000 tons. In 1919 they improved to 47,000

In 1920 and 1921 they increased to 136,503 tons and 58,397
respectively. Thus there is no trouble and no tariff problem
lved in importing adequate stocks of the principal raw material.

ood pulp: Sulphite wood pulp and even a little soda pulp are
in making the cheaper grades of writing paper. Soda pulp
es the same purpose as esparto pulp in producing a rather thick
ːr of soft, flexible texture. However, importations of chem-
wood pulp into this country are principally for other kinds of
er. The great demand for wood-pulp papers of other sorts,
ticularly printing paper, has helped to raise the prices and de-
ıse the available supply of wood pulp for making writing paper.
wever, the greater part of the wood pulp used by the American
ting paper industry is available in the United States. The re-
inder is imported principally from Canada and secondarily from
eden. It comes in free.

English china clay: English china clay, used to a limited extent
a filler in making writing paper, comes, of course, from England.
ıny paper manufacturers using it esteem it so much superior to
mestic china clay as to be practically a separate commodity.

Coloring materials: Coloring materials used to be imported from
ːrmany, but are now largely domestically produced. Experts
ate that the American colors so far developed are as good as the
erman dyes, but that the domestic industry has not yet developed

the great variety of German colors. Also, there are certain colors, such as the so-called indanthrene colors, which have been developed, but have not yet been made in sufficient quantity to be available to the paper industry. In particular, the industry needs indanthrene blue.

Envelope paper: As already noted, the materials of which envelopes are made include kraft and manila paper and certain other papers, as well as the fine paper discussed in this survey.

Equipment. Practically all the machinery and other equipment of the fine paper industry is manufactured in this country. Some paper machinery was purchased before the war from England and Germany. The American product appears, however, to be as satisfactory as any foreign paper machinery. The American writing-paper manufacturer is in as advantageous a position to secure equipment as the manufacturers in any other country.

Methods of production.—Fine paper is produced in the same way as printing paper, the process of making which is fully described in another survey, except that it often undergoes additional processes after leaving the Fourdrinier machine proper.

Preliminary processes, washing, beating, refining: The old rags are purchased in bales. They are sorted in the rag room and cut up by hand into smaller pieces, after which they usually go through a machine which cuts them into yet smaller pieces. The next process is to revolve them rapidly in a large hollow cylinder, in order to shake out the dust, buttons, and other foreign matter. They are then boiled in lime or in caustic soda in rotary, horizontal, cylindrical boilers. The resulting material, called half stuff, in which the threads are still largely existent in the woven form as cloth, is thereafter placed in washers and thoroughly washed. The washer is a large open oval tub divided in the middle lengthwise by a midfeather, so that a continuous channel exists in which the rag circulates in water. This machine is very much like the beater, described in the survey on printing paper. It is equipped with a cylindrical roll fitted with knives which revolve over a concave stationary bedplate likewise equipped with knives. The turning of this roll causes water and rags to circulate, the rags being cut up finer by the knives of the roll and bedplate. A revolving drum covered with wire cloth and partly submerged, continuously removes the dirty water while the clean water is being put in. After the washing, bleaching solution is added to bleach the rag stock, the bleach being mixed thoroughly by continued running of the washer roll. The stock is then clean and white and is ready for the beater. The fibers are not yet isolated, the stock being in the form of little bundles of threads which still retain in a small degree the appearance of the original woven cloth.

The rags are treated in a similar way, except processes. Sorting quality do not require even need to be added to prevent the a short one or is dis-

chemical wood pulp usually bought and not manufacturing companies' are the principal into the beater, where the paper-making

gins in earnest. Defective paper from the paper machines netimes thrown direct into the beater and given a prelimi- ng.

ıe beater[2] go also all the other materials which actually the texture of the paper. These are coloring matter, the ually rosin), the precipitating agent (alum), and the loading material (usually agalite or English clay), if any is used. beating is finished, the resulting stock is further refined in engine, consisting of a hollow steel cone inside which revolves cone.

rinier machine, finishing processes: The stock is then con- nuch diluted with water, to the Fourdrinier machine where de into a sheet of paper in much the same way as printing The cheaper grades of writing paper, particularly the all- variety, are made on machines almost exactly the same as aking machine-finished paper. They are of medium size and nd usually have calenders and rolls on the machine proper, give the paper its final finish and roll it up. The process is mplete, except for trimming and cutting the paper into the sheet sizes.

better varieties, however, which really constitute fine paper, de on slow, comparatively narrow machines. The paper is n the ordinary way and dried over steam-heated cylinders. ot calendered on the machine, but is passed through a tub of -glue sizing, made of animal hides. This imparts a surface paper that adapts it for receiving ink. Various methods of tub-sized paper are used. The best results are obtained from r loft drying. In this system the paper, wet from its tub-sizing is cut into sheets at the end of the paper machine and conveyed ts, where the sheets are hung in small bunches over horizontal en poles and dried by hot air. They are then smoothed or ironed remove the "cockle" or large wrinkle caused by their suspension he poles. This is the treatment ordinarily given fine bonds and igs, Bristol board, and, to a less extent, ledger paper. In many the sheets are calendered. Bond paper, however, is seldom more than a superficial calendering between steel and cotton Ledger paper and Fourdrinier-made Bristol board are always highly calendered. Ledger paper is sometimes dried on the ine in a manner that allows atmospheric drying and yet also the ig up of the paper dry at the end of the machine. This method ists in passing the paper from the tub-sizing bath over a very series of hollow, cylindrical rollers, the round surface of which ists of wooden cleats spaced a few inches apart. The atmosphere s the paper as it goes over these rollers. It is then rolled up and ndered. This is known as the Barber system. It is questionable, ever, if the results are as good as those of loft drying. Some ting paper is passed over steam-heated rollers after being tub d, but this process does not yield as fine a product as the other thods described.

As already stated, a great many special finishes, the most important which is linen finish, are given to the fine papers.

---

[2] The beater differs from the washer merely in the adjustment and sharpness of the knives and in not essing the washing drum.

Watermarks: Watermarks are almost universally used in making this grade of paper. These are ordinarily put in the paper by means of a dandy roll which stamps the design into the paper, causing a thinning of the pulp at that place. The ordinary watermark is a brand or trade-mark. Laid and so-called "wove" papers receive a sort of watermark from the dandy roll or from a special molding of the Fourdrinier wires. A laid paper is watermarked by a number of lines laid close together, intersected by lines at right angles, placed about 1 inch apart. A wove paper is a paper made on a woven wire, in which the wires cross and recross at even distances apart in a manner quite distinct from laid wires.

Envelopes: The great bulk of envelopes are made in special envelope-making plants on envelope machines which fold the paper into envelope form and put on the gumming material or clasp.

Organization.—The fine-paper industry is conducted by mills of smaller average size than those making newsprint, wrapping paper, and other papers of large output. This is partly because the nature of the product allows and requires a greater concentration of labor on quality as opposed to quantity, and partly because the processes of making wood pulp are seldom engaged in by fine-paper mills. They tend to confine themselves to preparing the rags and making them into paper, purchasing direct whatever wood pulp they need. Some mills of long-established reputation have only a few small paper machines and a few beaters and auxiliary machines. Their total product is a comparatively small amount of branded paper of great excellence.

Number of mills: In July, 1922, there were reported to be 103 mills in the United States making fine paper. The following table shows the number of mills making the principal grades of fine paper in 1920, according to reports made by the mills to Lockwood's Directory of the Paper and Allied Trades. Of course one mill in most cases produces a number of different kinds of paper:

Writing	67	Onionskin	11
Bond	61	Wedding	8
Ledger	37	Superfine	8
Drawing	21	Papeterie	7
Linen	18	Record	5
Tablet	17	Vellum	4
Typewriter	12		

In 1919 there were 106 establishments making envelopes in the United States, capitalized at $24,754,818. The manufacture of papeterie (stationery folded and prepared for writing purposes) and of paper boxes, as well as printing, is frequently carried on in connection with envelope making.

Geographical distribution.—The writing-paper industry is the most concentrated of any large branch of the paper industry. Two regions in western Massachusetts turn out nearly one-half of the fine paper of the country. These are the region including Holyoke, Mittineague, and other towns in the Connecticut River Valley and the region around Pittsfield in the valley of the Housatonic, including Dalton, Lee, Adams, Housatonic, etc. Other States of importance in writing-paper manufacture are Wisconsin, Pennsylvania, and Ohio.

Massachusetts is the principal State in the manufacture of envelopes. Illinois, Ohio, New York, and Connecticut follow in the order

Small amounts are produced in Pennsylvania and Missouri ttering amounts in other States.

ry of the industry.—The development of the writing-paper y has proceeded with greater continuity than that of any ranch of the paper industry. There has been no such shift in .terial as has taken place in making some other kinds of paper. rere the first raw material for fine paper in this country and e the principal raw material.

manufacture of envelopes in the United States is said to have about 1840. The census of 1849 was the first at which statis- ere presented, two establishments reporting with a product at $45,000. The number of establishments and the value of cts for each census from 1859 to 1919 are given in the following

Year.	Number of establishments.	Value of products.	Year.	Number of establishments.	Value of products.
.....	16	$763,700	1904.....	72	$10,222,366
.....	22	2,277,541	1909.....	78	13,458,522
.....	12	3,000,617	1914.....	90	18,481,013
.....	41	4,855,680	1919.....	106	39,664,000
.....	51	6,299,330			

mestic production and consumption.—Fine paper: The produc- of fine paper increased from 112,707 short tons in 1899 to 343,762 in 1919, and 389,322 tons in 1920. In other words, it trebled vo decades. In 1921 the industrial depression caused production ecrease to 242,485 tons, but it revived to 200,021 tons in the first n months of 1922. The value of the output increased from 895,974 in 1899 to $87,740,806 in 1919. No value figures are lable for years since 1919.

1 1919, 250,075 tons, or nearly four-fifths of the total fine-paper duction, consisted of writing paper as follows:

	Tons.
ger and highest grade.....	30,584
dried.....	48,564
dried.....	28,786
hine dried.....	59,674
hite bond.....	82,467
Total.....	250,075

As already noted, Massachusetts is the principal seat of the fine- per industry. The principal States producing writing paper are ssachusetts, Wisconsin, Pennsylvania, Ohio, and New Hampshire. e principal ones producing other grades of fine paper are Pennsyl- nia, New York, and Massachusetts.

Domestic production is sufficient to supply practically the whole of e demand for domestic consumption and to export a surplus. In e calendar year 1921 the United States imported an amount equal about one-third of 1 per cent of domestic production. As pointed t in the section on raw materials, the United States produces the eater part of the raw materials locally and does not have much ouble securing the remainder from abroad.

Envelopes: Production of envelopes, as has already been noted, creased from $6,299,330 in 1899 to $39,664,077 in 1919. No later

figures are available. Domestic production adequately meets the demand for domestic consumption; imports amounted to only four-hundredths of 1 per cent of production in 1919, and have greatly decreased since that time.

Domestic exports.—The exports of fine paper up to 1922 were not reported by quantity, and writing paper and envelopes were jointly reported. Exports of writing paper and envelopes increased in value from $1,267,117 in the fiscal year 1910 to $13,188,165 in the calendar year 1919. This represents in all probability at least a quadrupling in quantity. The increase began in 1916 and continued through 1919. In 1920 and 1921, however, exports decreased to $8,908,230 and $4,355,642, respectively. In the first seven months of 1922 they amounted to only 3,483 tons, valued at $1,129,732.[3]

In 1909 the value of exports of writing paper and envelopes amounted to 4.27 per cent of the value of domestic production, and in 1914 to 4.12 per cent. In 1919 the proportion exported was 15 per cent. In the first seven months of 1922, it was only 1.7 per cent by quantity.[4]

Destination of exports: The United States exports all over the world, principally to Australia, Brazil, Argentina, Cuba, Mexico, Philippine Islands, China, and Canada. Noteworthy in the great general increase in exports of writing paper from the United States is the decrease in exports to Canada. In the fiscal year 1913 the United States sent to Canada $550,624 worth of writing paper and envelopes, or about 40 per cent of the $1,351,226 total of writing-paper exports, to all countries. In the calendar year 1921, with prices considerably higher, this country sent to Canada only $319,743 worth out of a total of $4,355,642, or about 7 per cent.

Decrease in exports: The following table shows, month by month, from July, 1918, to December, 1921, the increase in exports of writing-paper and envelopes to a maximum in February, 1919, their diminution after June of that year, their temporary increase in the winter of 1920–21, and their decrease to a new low level for post-war exports in the latter part of 1921:

Month.	1918	1919	1920	1921
January		$1,794,365	$593,883	$1,372,442
February		2,594,766	697,277	831,667
March		1,806,110	685,282	374,251
April		1,161,139	623,575	322,678
May		1,288,732	698,465	243,618
June		1,217,854	699,178	177,092
July	$538,426	472,286	760,084	163,696
August	597,825	672,435	472,990	146,519
September	431,588	658,011	588,023	209,164
October	539,947	554,998	731,849	179,553
November	753,660	495,941	1,020,369	162,828
December	731,924	471,528	1,317,255	172,134

FOREIGN PRODUCTION.

The World, 1906–7.—In an appended table (p. 19) is shown the world's production in 1906–7 of fine paper, free from wood pulp. This table is of interest as giving some idea of comparative production in normal pre-war times, even though the year selected is nearly two decades removed. However, the paper covered by this table,

[3] Including Bristols and Bristol board.

[4] Not including envelopes.

ıs "fine paper free from wood pulp," quite evidently includes addition to writing paper and the other varieties discussed urvey. For instance, the United States and Canadian ə much higher than official figures published by this country da. There is probably a considerable amount of high-class er included, as well as other kinds of paper. Nevertheless, is of value as showing the relation of rag-paper production ɔuntry to that in other countries. Esparto may enter to ciable extent into the paper made in certain European as reported by this table.

ıited States appears to have had nearly twice the production earest rival, Germany. The United Kingdom produced ly as much as Germany. France and Austria-Hungary were nd fifth, respectively. Italy, Sweden, Canada, and other ı in Europe came next. It is the handmade and very finest f the United Kingdom, France, and Germany that are most compete with fine paper made in the United States. Italy ːes some handmade papers of very fine quality.

a, 1917 and 1919.—The Canadian fine-paper industry, although ll, is developing rapidly. Production of fine paper in Canada ł from 7,414 tons, valued at $1,999,778, in 1917 to 16,840 tons, ,t $5,405,666, in 1919. Writing paper represented the greater these amounts, increasing from 7,217 tons in 1917 to 10,230 1919. There are seven concerns in Canada making writing Although production of fine paper in Canada in 1919 was only ntieth of the amount produced in the United States, while the ıon of Canada is one-twelfth that of the United States, Canada bably soon have as great a per capita output of fine paper as ited States. Quebec produces a little more than half the paper and practically all the other fine paper made in Canada. rtheless, Canadian competition in fine paper need not be particularly by the United States. Although power is cheaper ,da than here, the conditions of labor cost, raw material, and ıre not such as to give Canada any particular advantage over ited States in fine-paper production, except in the wood-pulp ıs.[5] Canada no longer has cheaper labor for making paper ıe United States. It is said that Canadian labor for this ə is not so skilled or efficient as American labor, nor can , get rags more easily than the United States. In the last ˈears Canada has imported annually from the United States $400,000 worth of writing paper, papeteries, and envelopes, .parison with practically negligible exports of these items to ıited States. This fact is particularly significant when one ɔrs that in the fiscal year ended March, 1921, Canada exported)0 worth of writing paper in comparison with imports of ; paper, papeteries, and envelopes amounting to $441,000. ıer words, even with exports more than twice imports, and ; all the imports coming from the United States, Canada found ırket for writing paper in the United States. In the year March, 1922, total Canadian exports dropped to $84,000, but ts from the United States continued in little diminished volume.

---

ariff Information Survey, Wood Pulp, for relative costs of producing wood pulp in Canada and ɬtates.

IMPORTS.

Fine paper.—In the calendar year 1921 imports amounted to one-third of 1 per cent of domestic production. This was greater than during any previous year since 1914. In the fiscal year 1914 they were forty-four hundredths of 1 per cent of domestic production. Imports increased from 386 tons in the fiscal year 1909 to 1,082 tons in the fiscal year 1914. During the war they decreased considerably, but increased to 850 tons in the calendar year 1921.

Until after the fiscal year 1918, statistics of imports of fine paper distinguished only between paper ruled, bordered, embossed, lined, printed, or decorated, and fine paper not so treated. All but a very small proportion was in the latter category. In the fiscal year 1915, for instance, imports of fine paper thus specially treated amounted to about one-fifteenth of imports of fine paper not so treated. In the fiscal year 1918, however, this proportion increased to between one-fifth and one-sixth. In the second half of the calendar year 1918 imports were subdivided. Appended tables (pp. 21 and 22) show that imports in the calendar years 1919, 1920, and 1921, subdivided somewhat according to the arrangement in the tariff law. About two-thirds of the total in each of the three years consisted of writing paper not ruled, decorated, etc., including handmade, Japan, and onionskin paper. Imports of drawing paper represented most of the remainder; those of other kinds of fine paper were almost negligible. For instance, imports of so important a class of paper as ledger, bond, and record, amounted to less than 5 tons in each of the three years.

Envelopes.—Total imports of envelopes increased from $10,720 in the fiscal year 1907 to $29,349 in the fiscal year 1914, which was the largest amount imported in any year, and equaled about one-sixth of 1 per cent of production. After 1914, imports decreased. In the calendar year 1918 they were only $5,122, but recovered to $14,291 in the calendar year 1919, which represented one twenty-fifth of 1 per cent of production. Imports in 1920 and 1921, however, increased to $48,742 and $42,586, respectively.

From the fiscal year 1910 to October 3, 1913, when the different varieties of envelopes were reported together, the figures indicate that the value of annual imports of plain envelopes ran approximately the same as that of envelopes bordered, embossed, printed, tinted, decorated, or lined.

No figures by countries are available for imports of fine paper or envelopes.

PRICES.

Domestic, 1910–1922.—The prices of fine paper remained fairly constant from 1910 until the spring of 1916. Writing paper was steady at a range for different varieties of 4½ cents to 13½ cents per pound. The maximum range for different kinds of bond paper was 5 to 55 cents, and for ledger 5 to 30 cents. Prices increased considerably in 1916. During 1917, 1918, and 1919 they remained at about the level they reached in 1916. During the spring and summer of 1920 they increased again, reaching a high point in July that in most cases was maintained, at least nominally, up to the early part

the spring of 1921 they decreased materially. The

al the Toronto price was higher. Ledger paper sold at a
e in Toronto than in New York. The same was true for
pt from May to August, when it sold higher in New York.
aper commanded approximately the same price in both
ɔ to December, when the Toronto price jumped more than
Bond and ledger participated also in the December rise—
a time of general dullness in the paper business.

TARIFF HISTORY.

s of tariff acts, 1883 to 1913.—By the acts of 1883 and 1890
bore a duty of 25 per cent ad valorem. The designation
es differed somewhat under these early acts from that
later ones. Paper, n. s. p. f., was included in the same para-
oviding thus for any varieties of fine paper not actually
Paper envelopes were made dutiable in 1883, at the same
ne paper, viz, 25 per cent ad valorem, but the act of 1890
ed a specific duty of 25 cents per thousand envelopes. The
94 lowered the fine-paper duty to 20 per cent ad valorem,
he duty on envelopes the same, but placed a duty of 30 per
writing paper and envelopes, embossed, engraved, printed,
ıented.
ːt of 1897 provided a combination of specific and ad valorem
ine paper over 15 pounds in weight per ream bearing a
uty than paper up to 15 pounds. A 10 per cent ad valorem
ı addition to the above duties, was placed on fine paper

ruled, bordered, embossed, printed, or decorated. This change operated to increase the 20 per cent ad valorem duty of 1894 on fine paper not ruled, embossed, etc., to an ad valorem equivalent of about 33 or 34 per cent and the 30 per cent duty on fine paper ruled, embossed, etc., to an ad valorem equivalent of about 36 or 37 per cent, as shown by the import figures for the fiscal years 1907 to 1909. The duty on plain envelopes remained at 20 per cent ad valorem, that on envelopes bordered, embossed, etc., being raised from 30 to 35 per cent ad valorem.

The 1909 tariff law retained a combined specific and ad valorem duty on fine paper and the additional 10 per cent ad valorem on paper ruled, embossed, etc. This actually worked out to equalize the ad valorem equivalent duty collected on both grades and to increase it considerably over the 1897 rate. It ranged between 39 and 45 per cent, while the 1909 tariff was in operation. Paper envelopes remained at the 1897 rates.

The 1913 tariff abolished the distinction between fine paper and envelopes plain, and fine paper and envelopes ruled, bordered, embossed, or otherwise specially decorated in any manner, and imposed a flat ad valorem duty of 25 per cent on fine paper and 15 per cent on envelopes.

Effect of tariff on imports.—It is not possible to distinguish the effect of the tariff on the imports of fine paper. Under the tariff of 1909 imports suddenly increased and maintained or added to this increase during the whole time that the act was in operation, even though the equivalent ad valorem duty was considerably more than it had been previously. In the first year of the operation of the tariff act of 1913 (the fiscal year 1914) imports increased about a third. Since that time the war and its results have obscured the effect of the tariff. At any rate, it is certain that up to and including 1921 imports remained negligible. Imports of envelopes throughout the whole period concerned were less than one-fifth of 1 per cent of production and apparently had no connection with the level of the tariff.

COMPETITIVE CONDITIONS.

Europe before the war.—Before the war, Germany, France, the United Kingdom, and, to some extent, Italy sent high-grade writing paper to the United States. The tariff, however, was comparatively high, averaging nearly 45 per cent in ad valorem equivalent under the tariff act of 1909, although it was reduced to 25 per cent in 1913. The quantities imported were not large, the greatest amount entering in any year being a thousand tons in the fiscal year 1914, which was less than one-half of 1 per cent of domestic production.

Charges of dumping.—The complaint was often made, particularly in the case of Germany, that, like other kinds of paper, writing paper was dumped in the United States markets, at a price much below its cost of production, to ease a glut in the European market. Consignments of this sort, although relatively small, inflicted damage beyond what would be expected from the extent to which they increased the supply on the market. American antitrust laws prevented manufacturers here from combining to purchase the foreign offerings and from bringing them on the market in an orderly fashion. In spite of this, however, imports of fine paper did not seriously affect the American industry.

on to Europe.—At the present time (1922) very little ing imported and the industry is practically free from ition. Even in 1921 when intense international com- led, the imports of fine paper into the United States nly one-third of 1 per cent of domestic production.

Canada.—Although Canada is building up a fine-paper h in times of prosperity often exports an amount con- xcess of the fine paper imported into Canada, prac- t of these exports is sent to the United States. On d Canada imports regularly a considerable amount of m the United States. Only seven firms now make in Canada. Canada has not as satisfactory a supply r for making paper as has the United States; unskilled no cheaper in Canada than in this country. Rags are ly available to Canada than to the United States. r is Canada's only advantage except in the lower grades per, where wood pulp is the principal material used and less than it does the United States.

ss in recent years domestic exports to Canada have uch less important part of the total writing paper ex- e of an attempt on the part of the Canadians to produce pply of fine paper. As was pointed out above, domestic riting paper and envelopes to Canada decreased from of total exports to all countries in the fiscal year 1913 in the calendar year 1921. This is attributable largely npt now being made in Canada to build up Canadian general and to emphasize the desirability of production of as large as possible a portion of the commodities

Fine paper and envelopes—Rates of duty, 1883–1913.

Act of—	Par.	Tariff classification or description.	Rate of duty.
1883....	392	* * * demy, drawing, elephant, foolscap, imperial, letter, note, and all other paper not specially enumerated or provided for in this act.	25 per cent ad valorem.
	391	Paper envelopes	Do.
1890....	422	* * * writing paper, drawing-paper, and all other paper not specially provided for in this Act.	Do.
	421	Paper envelopes	25 cents per thousand.
1894....	310	* * * writing paper, drawing paper, and all other paper not specially provided for in this act.	20 per cent ad valorem.
	307	* * * writing paper and envelopes, embossed, engraved, printed or ornamented.	30 per cent ad valorem.
	309	Paper envelopes	20 per cent ad valorem.
1897....	401	Writing, letter, note, hand-made, drawing, ledger, bond, record, tablet, and typewriter paper, weighing not less than 10 pounds and not more than 15 pounds to the ream.	2 cents per pound and 10 per cent ad valorem.
		Weighing more than 15 pounds to the ream	3½ cents per pound and 15 per cent ad valorem.
		But if any such paper is ruled, bordered, embossed, printed, or decorated in any manner, it shall pay 10 per cent ad valorem in addition to the foregoing rates. *Provided*, That in computing the duty on such paper every 180,000 square inches shall be taken to be a ream.	10 per cent ad valorem additional.
	399	Paper envelopes, plain	20 per cent ad valorem.
		If bordered, embossed, printed, tinted, or decorated	35 per cent ad valorem.
1909....	413	Writing, letter, note, handmade paper and paper commercially known as handmade paper and machine handmade paper, japan paper, and imitation japan paper by whatever name known, and ledger, bond, record, tablet, typewriter, manifold, and onionskin and imitation onionskin papers, calendered or uncalendered, weighing 6½ pounds or over per ream.	3 cents per pound and 15 per cent ad valorem.
		But if any such paper is ruled, bordered, embossed, printed, lined, or decorated in any manner, other than by lithographic process, it shall pay 10 per centum ad valorem in addition to the foregoing rates: *Provided*, That in computing the duty on such paper every 180,000 square inches shall be taken to be a ream.	10 per cent ad valorem additional.
	414	Paper envelopes not specially provided for in this section, folded or flat, if plain.	20 per cent ad valorem.
		If bordered, embossed, printed, tinted, decorated, or lined	35 per cent ad valorem.
1913....	326	Writing, letter, note, drawing, handmade paper and paper commercially known as handmade paper and machine handmade paper, japan paper and imitation japan paper by whatever name known, and ledger, bond, record, tablet, typewriter, and onionskin and imitation onionskin papers, calendered or uncalendered, whether or not any such paper is ruled, bordered, embossed, printed, lined, or decorated in any manner.	25 per cent ad valorem.
	327	Paper envelopes, folded or flat, not specially provided for in this section.	15 per cent ad valorem.

Court and Treasury Decisions.

The provision in paragraph 401 of the act of 1897 for handmade paper was held not restricted to paper ejusdem generis with the writing, letter, and other papers enumerated in that paragraph; and handmade surface-coated paper was declared more specially provided for thereunder than under the provision in paragraph 398 for surface-coated paper not specially provided for. (United States *v.* Seyd, 158 Fed. 408.) The handmade papers covered by that paragraph and act were held not limited to the class of paper used for writing and drawing purposes, but applicable as well to printing and other papers when handmade and include transfer paper used for making lithographic transfers and not printed. (Benneche *v.* United States, 153 Fed. 861; G. A. 6581, T. D. 28128.) The word "handmade" as applied to paper was declared precise, explicit, specific, and controlling, and handmade paper weighing 10 pounds to the ream was held dutiable under paragraph 401 of the act of 1897. (American Trading Co. *v.* United States, 2 Ct. Cust. Appls. 237.)

flat envelopes and held that they were entitled to entry at 20 per cent ad valorem.

The rare and exceptional use of onionskin for printing purposes does not construct it printing paper, and it was held to be dutiable as paper not specially provided for under paragraph 402 of the act of 1913. (Kahlen *v.* United States, 2 Ct. Cust. Appls. 206.) The fact that a paper can be printed on is not alone sufficient to warrant its classification as printing paper. (G. A. 6521, T. D. 27848.)

Grease-proof paper, chiefly used for wrapping lard and other oleaginous substances, was held dutiable under paragraph 411 of the act of 1909, and not as onionskin paper under paragraph 413. (T. D. 32152.)

PREFACE.

This is one of a series of Tariff Information Surveys prepared by ıe United States Tariff Commission and transmitted to the Com-ıittee on Ways and Means. The series covers all of the articles nd commodities provided for in the tariff act of October 3, 1913, ınd others not specifically provided for. It is arranged in the ıumerical order of paragraphs of that act.

In some cases two or more paragraphs have been combined in ɔne pamphlet. In doing this, industrial relationship of the articles has been followed when possible. In those instances where a paragraph has been treated under a preceding paragraph of the tariff act, reference is made to this fact at the point where the paragraph appears in numerical order. Where one grade of an article is dutiable and another grade of the same article is on the free list, the article is discussed under the dutiable paragraph, which appears first in numerical order in the tariff act. In certain instances articles of close industrial relationship and which occur in separate paragraphs of the tariff act have been combined under one paragraph for convenience of discussion. Reference is made to this fact at the point where the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index," which contains:

1. An introductory chapter discussing the scope of the series and the general method of treatment.
2. An alphabetical index of the articles provided for in the tariff act of 1913, showing the paragraph of the act in which the article is provided for and, if discussed under a different paragraph, the number of such paragraph.
3. A list of the pamphlets in the series, showing the paragraphs and articles included in each pamphlet.

Thus by use of this "Introduction and index," the exact location of the discussion relating to a given article or commodity can be ascertained.

In the preparation of this report the Tariff Commission had the services of Constant Southworth, special expert of the commission's staff, and of others.

SURFACE-COATED, WAXED, GUMMED, DECALCOMANIA AND DECORATED PAPER.

General Information.

ACT OF 1913.

Paragraph 324: Papers wholly or partly covered with metal leaf or with gelatin or flock, papers with white coated surface or surfaces, calendar plate finished, hand-dipped marbleized paper, * * * and lithographic transfer paper not printed, 25 per centum ad valorem; papers with coated surface or surfaces suitable for covering boxes, not specially provided for, whether or not embossed or printed except by lithographic process, 40 per centum ad valorem; all other paper with coated surface or surfaces not specially provided for in this section; uncoated papers, gummed, or with the surface or surfaces wholly or partly decorated or covered with a design, fancy effect, pattern, or character, whether produced in the pulp or otherwise except by lithographic process, * * * 35 per centum ad valorem; * * *.

Paragraph 567: * * *' decalcomania paper not printed (free).

DESCRIPTION.

Surface-coated paper, as the name implies, is paper with one or both surfaces coated. A large proportion of that made in the United States is coated with clay. There are also some coatings with a metal base and others made of gelatin and other products.

Surface-coated paper, or coated paper as it will be hereinafter designated, is made in a great variety of grades and colors. This is true of the imported as well as of the domestic paper.

Coated book paper, used for printing illustrations and other printing purposes, is an important kind of coated paper. The base, a good grade of book paper, is usually coated on both sides.

Other kinds of coated paper are used mainly for covering boxes and for other fancy or decorative purposes. They are usually known as supercalendered, flint-glazed, friction-glazed, plated, embossed, waterproof, and fancy papers.

The 1913 tariff act names a number of kinds of coated paper according to the material or color of the coating, without specifically providing for coated book paper. The descriptions are so detailed as to require little explanation or elaboration. Flock, referred to in the first item of paragraph 324, is a coating substance made of finely ground wool, felt, or vegetable fiber. The term "calendar plate-finished" paper is a misnomer. The paper referred to is probably made by pressing between sheets of metal, with or without a cloth or other material to impart a design. Marbleized paper derives its name from the fact that it is coated to resemble the surface of a marble slab. Lithographic transfer paper not printed is a coated paper used in lithography for transferring designs to lithographic plates.

Such paper, when containing the imprints taken from lithographic plates, is provided for separately in paragraph 137. (See Tariff Information Survey C–15, p. 54.)

Gummed paper, used in making such articles as stickers, labels, stamps, and seals, is a kind of coated paper, in that it has one surface covered with glue or gum.

Decalcomania paper for transferring colored designs to glassware, porcelain, marble, and the like, is also a coated paper. It is covered with a vegetable gum or alumina coating, on which the design in colors is placed. The transfer of the design to the surface of the glassware or other article is effected by soaking the paper in water and then pressing it against the article to be decorated. The design readily adheres to the surface against which it is pressed, and the paper is easily torn off.

Waxed paper, another variety of coated paper, is not separately provided for in the act of 1913. It is used for wrapping and preserving bread, cake, and other bakery and food products, as well as for drugs, flowers, and other articles.

DOMESTIC PRODUCTION.

MATERIALS.

Machine-finish book paper, ordinarily made of chemical wood pulp, or a mixture of chemical wood pulp and rag pulp, is most used as a base for coated book paper; considerable amounts of groundwood, manila, and jute paper are also used in making other kinds of coated paper.

Clay, casein, and colors are the other ingredients of most importance. English china clay is much used for coating; most manufacturers consider it superior to the domestic clay for that purpose.

The following table shows in detail the materials other than paper used in making coated paper, together with the principal countries from which they are obtained:

Clay	England.	Oils	United States.
Casein	United States, Argentina, France.	Shellac	India.
		Carnauba wax	Brazil.
Pulp colors	United States, Germany.	Stearic acid	United States.
Aniline dyes	United States.	Talc	Do.
Earth colors	Do.	Ceresin	United States, Austria.
Ammonia	Do.	Soap	United States.
Blanc fixe	Do.	Satin white	Do.
Borax	Do.	Paris white	Do.
Glue	Do.		

In making waxed or paraffin paper a variety of raw paper is used, ranging in weight from tissue paper to a fairly heavy grade, and in material from all ground wood to part rag. Rag paper is usually too expensive, however, to use for this purpose, ground wood and sulphite wood pulp being principally used. Most of the paraffin is secured in the United States; the best grades are imported. In 1920, 2,350 tons of paraffin, valued at $502,500, were imported by 19 members of the Waxed Paper Manufacturers' Association. This wax came principally from Borneo and India. It is preferred because its melting point is higher than that of domestic wax, because of its general superiority and its lower cost.

In making gummed paper, a wood pulp paper, almost invariably of domestic origin, is usually used as a base. Kraft, book, writing, glassine, and manila papers are used, as well as tissue and coated papers and certain papers especially sized and prepared for the purpose. The weights range ordinarily from medium to heavy. Papers for gumming usually weigh not over 35 pounds per ream of 500 sheets 17 by 22 inches. For making strong, heavy gummed paper, however, kraft paper up to 100 pounds per ream is often used.

The adhesive applied to the raw paper is usually animal glue (made of bones and hides) obtained as a by-product from the packing industry. Fish glue, dextrine, envelope gum, and gum arabic also serve as adhesives as well as small amounts of glucose, glycerin, starch, and sugar.

In the manufacture of decalcomania paper, unsized book paper, starch, flour, and gum are used.

EQUIPMENT.

Machinery used in the United States for coating paper is produced principally in this country, but some of it comes from Germany. Some coating-paper manufacturers consider the German machines more efficient and up to date, and there is little question that they are cheaper. However, other manufacturers find the American machines satisfactory.

The machinery used in making waxed, gummed, and decalcomania paper is manufactured almost entirely in the United States. A very small amount of machinery for gumming is imported from Germany. A prominent American manufacturer of gummed paper states that the foreign gumming machines are inferior in quality to the American and that they are less efficient.

METHODS OF PRODUCTION.

Coated paper.—In making coated paper the coloring matter, china clay, casein, glue, and whatever other materials are used are thoroughly mixed. The clay constitutes the body of the coating material, while the casein and the glue bind it together and cause it to adhere to the paper. The mixture is conveyed to the coating machines, which apply it to the paper on one or both sides by means of rolls or brushes and distribute it evenly by means of reciprocating brushes. The paper, gathered in festoons, then moves slowly for a long distance through a hot air blast. After this process, it is dry and rolled up. It then has a rather rough, dull surface, and is ordinarily finished by one of the following methods:

(1) Running it through a set of alternate steel and cotton rolls, the surface speed of every roll being the same; this is known as supercalendering.

(2) Running it between a steel roll and a cotton roll, the surface speed of the steel roll being considerably greater than that of the cotton roll; this is known as friction calendering. The product is called friction-glazed paper.

(3) Rubbing it mechanically with a flint stone; this is known as flinting. The product is called flint-glazed paper.

(4) Pressing it mechanically between sheets of metal with or without a cloth or other material to impart design; this is known as plating. The product is called plated paper.

There are also certain other finishes such as enameled or brush, imparted by cylinder brushes, and waterproof or leather, imparted by giving an extra coating of shellac.

Many of the papers finished in the various ways described are subsequently embossed by being passed under pressure between engraved rolls or cylinders. They are also frequently imprinted with designs from engraved rolls by the use of a printing machine similar to the machines used in producing cotton calico prints.

After the paper is finished by any of the processes described it is then ready to be cut up into sheets and sorted to remove imperfections or to be shipped in rolls of standard size.

Waxed paper.—The process of waxing paper is simpler than that of coating. The wax is heated and the paper unreeling from rolls is passed through it. If only one side is to be waxed, the wax is applied with two rollers in contact with each other, one touching one side of the paper and the other revolving partially submerged in the melted wax. The drying, or rather hardening, is accomplished by running the paper over cold rollers (where only one side of the paper is waxed) or by passing it through a cold blast or cold water. In the latter case, the adhering water is rubbed off by means of rollers. The paper is then rolled up and cut and trimmed into the proper sizes.

Gummed paper.—The glue is dissolved in water and the solution placed in the trough of the gumming machine. The paper, unreeling from rolls, passes through the machine. The process of applying the glue is the same as that of waxing paper on one side only. The glue is applied by means of rollers. One revolves partially submerged in the trough of glue. Another, in contact with it, takes the glue off and applies it to the paper. The paper is dried by passing it through hot air in a closed-in chamber, by passing it around hot rolls, or by some similar method. It is then rolled up, cut, and trimmed.

Decalcomania paper.—Because the function of this paper is to serve as a medium for transferring designs to glassware, porcelain, marble, and the like, it must have a surface firm enough to take the design but which readily breaks up when the printed side is pressed against the object intended to receive the design. To produce such a surface, one side of the paper is coated with starch, flour, and gum separately or mixed. For instance, a paper may first be dusted over with dry starch or coated with starch paste and dried. Then a layer of dextrin may be put over the starch coating and the design printed upon the dextrin surface. Different coating materials are used, according to the class of work in hand, but the principle of an easily detached surface coating is the same for all.

The finished decalcomania, made by printing designs on the coated paper, is turned face downward on the sticky surface of the article to be decorated. It is moistened either before or after this process. The design adheres to the new surface; the paper is easily pulled off, because the starch layer between it and the dextrin is non-adhesive.

ORGANIZATION AND GEOGRAPHIC DISTRIBUTION.

The coated-paper industry embraces some 50 or more companies, 18 of which constitute the Glazed and Fancy Paper Manufacturers' Association. The Waxed Paper Manufacturers' Association consists of 22 members, who produce 85 per cent of the waxed-paper output of the country. There are only about 15 companies manufacturing gummed paper.

The various kinds of coated paper, as in the case of the unconverted "raw" paper, are made principally in the northeastern section of the United States. Massachusetts, New York, Michigan, Rhode Island, and Pennsylvania are the most important manufacturing States. Ohio, Indiana, New Jersey, West Virginia, Virginia, New Hampshire, Connecticut, Maine, and Vermont also contain factories.

Ohio, Michigan, New Jersey, and New York are the principal seats of the waxed-paper industry. New Hampshire, Massachusetts, Illinois, Vermont, Missouri, California, and Wisconsin each contain one or two factories.

Massachusetts, New York, Ohio, New Hampshire, Vermont, and New Jersey contain gummed-paper mills.

DOMESTIC PRODUCTION AND CONSUMPTION.

Coated paper.—The following table shows the amount and value of the 1920 production of the kinds of paper in question by 15 of the 18 concerns constituting the Glazed and Fancy Paper Manufacturers' Association. The classifications follow the wording of the tariff act of 1909. It must be remembered that these figures represent only a small part of the total output of coated paper.

Class of paper.	Companies reporting.	Production during 1920.	Shipments during 1920.		
			Quantity.	Value.	Average value per pound.
	Number.	*Tons.*	*Tons.*		*Cents.*
1. Papers with white coated surface or surfaces (calender plate finish)	15	4,719	4,762	$1,787,064	18.7
2. Papers with coated surface or surfaces suitable for covering boxes, n. s. p. f.	15	11,275	10,081	4,251,846	21.1
3. Papers uncoated, printed, or decorated, etc., and cloth-lined papers	15	1,361	1,318	1,109,616	23.2

In 1920 these 15 companies employed an average of 991 males and 237 females, exclusive of office and selling force.

In the years 1914 and 1919, according to the United States census, the production of coated book paper was 117,342 tons, valued at $11,605,584, and 132,000 tons, valued at $24,010,000, respectively.

Other kinds.—The production of the 22 companies representing the Waxed Paper Manufacturers' Association was 46,880 tons, valued at $17,152,601; this was approximately 85 per cent of the total waxed paper made in the United States during the 12 months ended January, 1921.

No statistics for the production of gummed paper are available.

The annual output of decalcomania paper is estimated at 100 ton valued at $80,000. As the imports of decalcomania paper in 19 were valued at $186,000, it is evident that domestic productio provides only a small fraction of domestic consumption. The indu try is a new one in this country, having been carried on only sinc 1916. Manufacturers of decalcomania paper estimate domest consumption at 600 tons annually. This is probably an overstat ment, however, for in 1920 the value of the imports was only a litt more than twice the value of domestic production.

Domestic production of the other kinds of paper in question supplie practically the whole demand for home consumption.

DOMESTIC EXPORTS.

Information relative to exports of coated paper is not available. table in the statistical part of this section shows exports of waxe paper by countries, from 1918 to 1921, in terms of value only. Th totals exported were $228,137 in 1918, $552,167 in 1919, $403,81 in 1920, and $133,134 in 1921. Argentina, Canada, China, Cuba Australia, and the Philippine Islands were the principal recipients o this paper. Exports of gummed paper appear to be almost negligibl in quantity. One large manufacturer in 1920 exported 295 ream out of a total production of 31,445 reams to Great Britain, Denmark Australasia, and South America.

IMPORTS.

The imports for consumption of the different kinds of coated paper as specified in the tariff acts of 1897, 1909, and 1913, are shown in appended tables. In recent years the total imports of coated paper have been of small importance. In the last four years the kind imported in greatest quantity has been coated paper, n. s. p. f. During the first three years of the operation of the act of 1913 (the fiscal years 1914 to 1916) coated paper suitable for covering boxes was imported in quantities greatly exceeding the imports of any other kind of coated paper.

The table of imports by countries summarizes importations of all kinds of coated paper. From 1910 to 1915 imports ranged from 4,500,000 to 7,000,000 pounds per year. After 1915 they dropped suddenly and continued to decline to 134,418 pounds in the calendar year 1919. In the calendar year 1920 imports increased to 914,124 pounds, and in 1921 they amounted to 751,061 pounds.

Because of the lack of complete production figures, it is impossible to state the ratio of imports to production. It may be pointed out, however, that in 1914, when imports of coated paper were the greatest of any year during the last decade, namely, 3,500 tons, the production of coated book paper alone was 117,342 tons. In the fiscal year 1921 the productive capacity of the domestic coated paper industry was certainly larger than in 1914, yet imports amounted to less than 600 tons. It is therefore apparent that importations of coated paper represent an extremely small percentage of domestic production.

Before the war Germany, Belgium, and the United Kingdom, in the order named, were the greatest exporters of coated paper to the United States. In the calendar years 1918 and 1919 France, Sweden,

ınd the Netherlands were our principal sources; in 1920 Germany ıad again resumed first place on our import trade in coated paper, ıending us more than half of our total imports in that year.

No separate figures are obtainable for imports of waxed paper. ıccording to manufactures, imports come principally from Germaany, England, Sweden, Canada, and Austria.

Imports of gummed paper can not be separated from those of ecorated paper. Imports of "papers, uncoated, gummed, or with ıe surface decorated or covered with a design, fancy effect, pattern, r character, whether produced in the pulp or otherwise, except y lithographic process," shown in a table at the end of this survey, ınged from a little below 200,000 pounds to about 350,000 annually om 1914 to 1918, except in 1917, when they fell to 57,328 pounds. fter 1918 imports of these kinds of paper almost ceased. In the lendar year 1920 they amounted to 29,641 pounds and in 1921 to),735 pounds. Manufacturers say that imports of gummed paper me principally from Great Britain and Germany, but that the gregate is small.

Tables in the statistical section of this survey show the value of ports for consumption of decalcomania paper from 1914 to 1921 d of imports by countries from 1918 to 1921. The value of the mer increased from $36,302 in the fiscal year 1914 to $185,579 in) calendar year 1920 and to $184,586 in 1921. In 1918 and 1919 ıctically all these imports came from England; Canada sent the ıainder, an insignificant amount. In 1920, Germany sent us alcomania paper valued at $17,610, and France, Austria, and ıada negligible amounts. England retained undisputed lead h $165,130.

PRICES.

he wholesale mill prices of standard grades of coated paper in 1914, and in July 1917–1921 are given in the following table:[1]

Grade.	Per ream of 480 sheets 20 by 24 inches.[2]				
	1914	1917	1918	1920	1921
glazed (low grade) on groundwood paper	$1.25	$1.75	$2.10	$5.00	$2.00
glazed (better grade) on free-from-groundwood paper	1.80	2.50	2.75	6.50	2.85
glazed US No. 13	1.75	2.40	2.75	5.75	2.90
ızed US No. 19	2.10	4.00	4.50	6.50	3.85
lazed US No. 30	2.10	3.25	3.50	6.50	4.00
itho (medium grade) clay coating on free-from-ground-stock, per pound	.05½	.08	.09½	.21½	.10½

res furnished by the Nashua Gummed & Coated Paper Co.
pt white litho, which is per pound.

will be noted that between July 1, 1914, and July 1, 1918, the on the quoted grades in most instances nearly doubled. One more than doubled in price. Between July 1, 1918, and July 0, four of these grades more than doubled their prices, and the of the others greatly increased. A rapid decline took place latter part of 1920. On July 1, 1921, prices again stood at ximately their 1918 levels.

It is interesting to compare the average values of the coated paper made in 1920 by 15 members of the Glazed & Fancy Paper Manufacturers Association with the average values of the same kinds of paper imported in that year. The following table, compiled from figures furnished by the above association and from United States import statistics, presents this comparison:

Grade.	Average price of domestic output of 15 companies in 1920.	Average price of imports in 1920.
	Cents per pound.	*Cents per pound.*
Paper with white coated surface or surfaces, calender plate finish	18.7	45.0
Paper with coated surface or surfaces suitable for covering boxes, n. s. p. f.	21.1	17.4
Paper uncoated, printed, or decorated, etc., and cloth-lined paper	21.2	.....
Paper, uncoated, gummed, or decorated, etc	.....	47.3

It will be noted that imports of white coated paper, calender plate finish, averaged two and one-half times the value per pound of the domestic output of the 15 concerns reporting. The price of imported coated paper suitable for covering boxes was slightly less than the price of the domestic paper of the same kind. As the price of domestic uncoated decorated papers includes cloth-lined paper but not gummed paper, and the price of the imported uncoated decorated papers includes gummed paper but not cloth-lined paper, the two can not be directly compared. The imported grade in 1920 averaged twice the price of the domestic grade.

In all these comparisons it must be borne in mind that the grades of paper in question vary so greatly that the comparison of any two independent sets of prices is often misleading.

The average market value of the waxed paper produced in the 12 months ended January, 1921, by the members of the Waxed Paper Manufacturers' Association, was 18.3 cents per pound.

There is no definitely standardized grading of gummed paper; each manufacturer has his own grades. The following table of the selling prices was compiled from figures furnished by two large manufacturers of gummed paper. The quotations are for certain of their more important grades in July of the several years from 1914 to 1921. The actual sales prices per ream of varying weights are shown, as well as the prices per pound, calculated by a reduction of the ream prices.

July—	Nos. 104 and 700 in reams of 500 sheets, 17 by 22 inches, weighing 22 pounds per ream.[1]		No. 1, in reams of 500 sheets, 20 by 25 inches, weighing 31 pounds per ream.[2]	
	Per ream.	*Per pound.*	*Per ream.*	*Per pound.*
1914	$2.10	$0.095	$6.75	$0.218
1915	.....	.....	6.75	.218
1916	2.85	.130	7.00	.226
1917	.....	.....	8.25	.266
1918	3.50	.159	8.25	.266
1919	.....	.....	10.50	.339
1920	5.75	.261	10.50	.339
1921	4.00	.182	14.00	.452

[1] Furnished by Samuel Jones & Co., Newark, N. J.
[2] Furnished by Dennison Manufacturing Co., Framingham, Mass.

It will be noted that the price on No. 1 gummed paper, furnished by the Dennison Manufacturing Co., instead of being greatly reduced between July of 1920 and July of 1921, as was the case with the other gummed papers quoted and with practically all other kinds of paper, was much higher in July of 1921 than in July of any preceding year. It is probable that special conditions of demand for this particular grade of gummed paper in general account for this phenomenon.

The following are the ream and pound prices in July of 1918, 1920, and 1921 on No. 60 decalcomania paper produced by Samuel Jones & Co.

July—	Per ream of 500 sheets, 17 by 22 inches, weighing 27 pounds.	Per pound.
.....	$7.00	$0.259
.....	9.00	.333
.....	8.00	.296

TARIFF HISTORY.

The act of 1890 was the first tariff act to name coated paper separately. It imposed a duty of 35 per cent on all coated paper. The act of 1894 lowered the rate to 30 per cent. The act of 1897 separated paper covered with metal, gelatin, or flock from other coated paper, imposing a combined ad valorem and specific duty on each kind, the higher rate being on the specially treated paper. The 1909 act refined the 1897 classification; except that it imposed a higher duty separately on metal-coated paper beneath a certain weight, and also introduced a provision for decorated papers, specifically including decorated wrapping paper. The 1909 duties were specific and combined specific and ad valorem rates. The act of 1913 specially provides for a considerable variety of coated papers, bearing ad valorem duties ranging from 25 to 40 per cent. The 1909 item for coated papers was changed to include specifically uncoated papers. Enamed papers were also introduced into this item. Decalcomania paper was first named in the act of 1913. It was put on the free list.

COMPETITIVE CONDITIONS.

COATED PAPER.

As has been pointed out, imports of coated paper apparently constitute an insignificant proportion of domestic production. Judging from the foregoing comparison of prices of the domestic product with those of imported coated paper in 1920, and also from the small amount of importations, it may be assumed that the imported product is ordinarily in the nature of a specialty and costs more than the domestic product. With an average price as high as recently prevailing on imported coated paper, it hardly seems likely that foreign competition would be keenly felt outside of the finer grades.

Some manufacturers state that immediately following the passage of the act of 1913, the Germans and others dumped coated paper into this country at prices which in many cases caused partial shutdowns in the domestic industry. War conditions cut off foreign competition from 1914 to 1920, but now that trade has been resumed manufacturers again express fear of European dumping. As a matter of fact, however, the general trade depression just prior to the war was the most important cause of the shutdowns in 1913 and 1914. It is difficult to isolate the effect of the lowered tariff in contributing to this depression. Practically all of the coated paper imported from the time the act of 1913 took effect (October 4, 1913) to June 30, 1914, was dutiable at the highest rate specified on paper—40 per cent. This duty was not much lower than the average ad valorem equivalent duty collected on coated paper imports from July 1 to October 3, 1913, under the act of 1909. This average ad valorem equivalent duty was 47½ per cent.

WAXED, GUMMED, AND DECALCOMANIA PAPER.

The waxed-paper industry of the United States is confronted with practically no foreign competition, though in certain quarters fear is expressed regarding the development of the industry in Canada. The gummed-paper industry also is practically independent of foreign competition, imports being practically negligible.

The manufacturers of decalcomania paper, however, are in the position of an infant industry. In 1916, as stated above, decalcomania-paper production began in this country. By the act of 1913, decalcomania paper had been placed on the free list. War conditions enabled American manufacturers of gummed paper to start making decalcomania paper, without serious foreign competition. They now claim, however, that the continuance of decalcomania paper on the free list would ruin their business. There seems to be no reason why decalcomania paper should not bear the same duty as gummed paper.

RATES OF DUTY.

Surface-coated, gummed, decalcomania, and decorated paper.

Act of—	Par.	Tariff classification or description.	Rate of duty.
1890	420	Papers known commercially as surface-coated papers, and manufactures thereof * * *.	35 per cent ad valorem.
1894	308	* * * surface-coated papers, and manufactures thereof, * * *.	30 per cent ad valorem.
1897	398	Surface-coated papers not specially provided for in this Act.....	2½ cents per pound and 15 per cent ad valorem.
		If printed, or wholly or partly covered with metal or its solutions, or with gelatin or flock.	3 cents per pound and 20 per cent ad valorem.
1909	411	Papers with coated surface or surfaces, not specially provided for in this section.	5 cents per pound.
		If wholly or partly covered with metal or its solutions (except as hereinafter provided), or with gelatin or flock, or if embossed or printed.	5 cents per pound and 20 per cent ad valorem.
		Papers, including wrapping paper, with the surface decorated or covered with a design, fancy effect, pattern, or character whether produced in the pulp or otherwise, but not by lithographic process.	4½ cents per pound.
		If embossed, or wholly or partly covered with metal or its solutions, or with gelatin or flock.	5 cents per pound and 20 per cent ad valorem.
		Provided, That paper wholly or partly covered with metal or its solutions, and weighing less than fifteen pounds per ream of four hundred and eighty sheets, on a basis of twenty by twenty-five inches, shall pay a duty of—	5 cents per pound and 25 per cent ad valorem.
1913	324	Papers wholly or partly covered with metal leaf or with gelatin or flock, papers with white coated surface or surfaces, calender plate finished, hand dipped marbleized paper, * * * and lithographic transfer paper not printed, * * *.	25 per cent ad valorem.
		* * * Papers with coated surface or surfaces suitable for covering boxes, not specially provided for, whether or not embossed or printed except by lithographic process * * *.	40 per cent ad valorem.
		* * * All other paper with coated surface or surfaces not specially provided for in this section * * *.	35 per cent ad valorem.
		* * * Uncoated papers, gummed, or with the surface or surfaces wholly or partly decorated or covered with a design, fancy effect, pattern, or character, whether produced in the pulp or otherwise except by lithographic process * * *.	Do.
	567	* * * decalcomania paper not printed.....	Free.

COURT AND TREASURY DECISIONS.

"Surface" has no particular trade meaning different from the usual understanding of the word and applies alike to both sides of a paper, one of which is rough and uncalendered and the other smooth and finished. Where a design or pattern is embossed on one side of a paper, the paper is one the surface of which is "decorated or covered with a design." (G. A. 6937, T. D. 30083, of 1909; see also Dunn *v.* United States, 2 Ct. Cust. Appls., 65.)

So-called lithographic transfer paper, covered with a preparation and used for the purpose of transferring lithographic impressions from one stone to another, was held under the act of 1897 not to be a surface-coated paper because not known in trade as such. (G. A. 4794, T. D. 22584, of 1900.) Nor was paper coated on one side with mucilage and intended for use in making labels and paper boxes. (G. A. 4837, T. D. 22723, of 1901.) But paper covered with barium platinum cyanide crystals, used in Röntgen-ray apparatus to show the shadow, was held dutiable as surface-coated paper. (G. A. 5009, T. D. 23322, of 1901.) In a decision, however, under the act of 1913, surface-coated paper known as Röntgen-ray or X-ray paper used in connection with X-ray photography, was held properly classable under the provision for "albuminized or sensitized paper or paper otherwise surface-coated for photographic purposes" in paragraph 324

ın under the provision in said paragraph for "all other paper
ed surface or surfaces not specially provided for." (G. A.
D. 36419, of 1916; followed in Abstracts 40208, of 1916;
1917; and 42076, of 1918.) A handmade surface-coated
ı held dutiable under paragraph 401 of the act of 1897 as
ı paper decorated and not as surface-coated paper under
398. (G. A. 6687, T. D. 28593, of 1907.)
iff provision for lithographic prints appeared for the first
ıe tariff act of 1890. From that time until 1903 decalco-
ıre classified for tariff purposes as lithographic prints. In
an importation of decalcomania pictures was classified by
ıor as lithographic prints under paragraph 400 of the act
The importers, who admitted they represented domestic
ırers and had made this importation for the purpose of secur-
ıdication which if successful would result in granting them
tariff protection, contended that the merchandise was
lutiable at a higher rate under paragraph 400 as labels
whole or part in metal leaf. The protest was overruled
15, T. D. 24723, of 1903), but this decision was reversed
rcuit Court for the Northern District of Illinois, no
being presented by the Government (Wakem *v.* United
D. 25827). The decision of the circuit court, however,
llowed by the Treasury Department, which, after taking
ı of the Attorney General, said it was not incumbent upon
ment to accept the ruling of the court, and instructed
ficials to continue to impose the lower rate on such mer-
ı lithographic prints. (T. D. 25848, of 1904.)
ıanias printed lithographically from stone and used to
decorative picture or design to the surface of various
re held to be dutiable as lithographic prints under para-
f the act of 1897, and not dutiable as surface-coated paper,
der paragraph 398, nor as manufactures in chief value
ıder paragraph 193. In this case the importation was
/ the collector as surface-coated paper, printed, and the
ıimed it was dutiable as lithographic prints. At the trial
ers failed to appear, but special counsel representing
anufacturers, the same firm interested in the case of
United States, supra, appeared and contended that
rate claimed by the importers nor that assessed by
· was correct, but that by reason of the fact that mineral
used in printing the articles they were properly dutiable
raph 193 as manufactures in chief value of metal at a
ıf duty. The board rejected this contention, relying upon
ırthur *v.* Moller (97 U. S. 365) decided 30 years previous
ıions of the courts, the board, and practice of the classify-
or 30 years. (G. A. 6630, T. D. 28277, of 1907.) An
taken from this decision to the United States Circuit
rn District of Pennsylvania, where it was reversed, and
dise held to be surface-coated paper wholly or partly
metal under paragraph 398. (United States *v.* Hemp-
ed. 290; T. D. 28820.)
case, however, the Court of Customs Appeals refused to
ıcision of the circuit court, saying that it appeared the
in that court were really ex parte and therefore the

decision could not be given the weight it otherwise would have had. (United States *v.* Borgfeldt, 2 Ct. Cust. Appls., 197, of 1911.)

Paper used in the printing of decalcomanias, single transfer, is a one-thickness paper the surface of which is coated with a preparation of gum and duplex lithotransfer, is made of two layers united, the lower being plain and the upper coated with a gummy substance. This paper when lithographically printed is used to transfer lithographic impressions to pottery ware, etc. Such papers were held to come within paragraph 411 of the act of 1909. By changing the phrase "surface-coated papers, not specially provided for," in paragraph 398 of the act of 1897, to "papers with coated surface or surfaces, not specially provided for" in paragraph 411 of the act of 1909, Congress intended that such papers that in fact have a coated surface or surfaces should come within paragraph 411. (American Express Company *v.* United States, 2 Ct. Cust. Appls. 459, of 1912.)

Decalcomanias in ceramic colors, backed with metal leaf, were held to be dutiable at 65 cents per pound under paragraph 412 of the act of 1909 and decalcomanias not of that kind (except toy decalcomanias) were held to come within the provision for all other decalcomanias in that paragraph. (United States *v.* Palm, 4 Ct. Cust. Appls. 1, of 1913.)

Plain paper coated with metal, either by applying a metal wash thereto or by pasting metal leaf thereon, was held to be paper covered with metal or its solutions within the meaning of paragraph 411. (Kupfer *v.* United States, 2 Ct. Cust. Appls. 302, of 1911.)

Paper subjected to processes by which, after a finished design in colors had been imprinted on it, it was saturated with linseed oil and no varnish or other substance was applied to produce an added surface, was held not to be a surface-coated paper, but dutiable as a paper with the surface decorated or covered with a design, fancy effect, pattern, or character within paragraph 411 of the act of 1909. (Knauth *v.* United States, 4 Ct. Cust. Appls. 11, of 1913.)

White surface-coated paper, flint-glazed, suitable for covering boxes, was held to be dutiable under paragraph 324 of the act of 1913 as "papers with coated surface or surfaces suitable for covering boxes" rather than under the provision in the same paragraph for "papers with white coated surface or surfaces, calender plate finished." (G. A. 7808, T. D. 35878, of 1915.)

Paper coated with a solution of powdered tin and suitable for use in covering the edges of boxes was held to come within the provision in paragraph 324 of the act of 1913 for "papers with coated surface or surfaces suitable for covering boxes" rather than under the provision in said paragraph for "papers wholly or partly covered with metal leaf" or "paper with coated surface or surfaces not specially provided for." (G. A. 7945, T. D. 36588, of 1916.)

Paper one side of which showed mottled effects in various colors was held to have been properly classified as "papers with coated surface or surfaces suitable for covering boxes" under paragraph 324 of the act of 1913, the importers failing to prove that the colored matter appearing on the surface of the paper was not in fact a coating. (Abstract 40074, of 1916.)

Photographic mounts or holders, composed wholly or in chief value of imitation parchment paper or of paper with the surface decorated or covered with a design or pattern, were held dutiable

ific provision for articles so composed in paragraph 324
1913 rather than under the provision in paragraph 332
ires of paper. Similar articles composed of cardboard
under paragraph 332 as manufactures of paper rather
ragraph 324 as manufactures of surface decorated paper.
T. D. 36191, of 1916; Abstracts 39492, of 1916; 39852,
3, of 1917; 41029, of 1917; 41740, of 1918.)
l initials made from metal-coated and surface-coated
within paragraph 324 of the act of 1913. (Abstracts
3; 42552, of 1918.)
white-coated surface, calender plate finished, and in-
ite blocking paper, was held to be a calender plate
within the meaning of the descriptive provision there-
aph 324 of the act of 1913. (Abstract 40075, of 1916;
ostracts 40468, of 1916; 41273, of 1917; 41843, of 1918.)
vn as "Perlmutter," one surface of which has not been
other having been treated with a layer of gelatin and
f lacquer, presenting a shiny, glossy, and variegated ap-
surface-coated paper within paragraph 324 of the act of
dutiable under the provision in that paragraph for "pa-
or partly covered with metal leaf or with gelatin or
with white-coated surface or surfaces." (Bendix Paper
States, 8 Ct. Cust. Appls. 366, of 1918.)
rdboard bells used in the manufacture of Christmas-
its were held not to be dutiable as articles composed
ated paper under paragraph 324 of the act of 1913, but
anufactures of paper, it being shown that the articles
after being manufactured. (G. A. 8317, T. D. 38255, of

CLOTH-LINED OR REINFORCED PAPER.

General Information.

paragraph 324: * * * cloth-lined or reinforced papers, * * *
d valorem. * * *.

DESCRIPTION.

"cloth-lined or reinforced paper" is self-descriptive.
sometimes used where an especially strong, nontearable
cking paper is needed, but there are also cheaper grades
t very durable. It is much used in merchandise ship-
cularly for lining cases or covering machinery shipped
l for outside coverings for cases shipped on flat cars.

DOMESTIC PRODUCTION.

—Kraft paper made entirely of sulphate wood pulp is
ost commonly cloth lines or otherwise reinforced, for
is the strongest and toughest wood-pulp paper. To some
er papers are used. Asphalt is used for cementing pur-

t.—The machinery used in lining paper with cloth or
inforcing it is mainly of domestic manufacture.

Methods of production. In making cloth-lined paper, one sheet of paper is coated with a layer of asphalt. A sheet of cloth is then superimposed thereon while the asphalt is hot. In making string reinforced paper, string is laid over the asphalt-coated paper. A sheet of paper is placed on top, and the whole thing pressed firmly together.

Geographic distribution. Of 9 mills reporting to Lockwood's Directory of the Paper and Allied Trades as manufacturing cloth lined paper in 1920, 5 are in Massachusetts, 2 in New York, 1 in New Hampshire, and 1 in Pennsylvania.

Amount of output. The annual production of cloth-lined paper in the United States is estimated at 1,000 to 1,500 tons.

Domestic exports. Domestic exports of cloth-lined paper are negligible.

IMPORTS.

The following table shows our imports for consumption of reinforced or cloth-lined paper from the fiscal year 1914 through the calendar year 1921.

IMPORTS FOR CONSUMPTION—REVENUE.

Reinforced or cloth lined paper (act of 1913).

Year.	Rate of duty.	Quantity.	Value.	Duty collected.	Value per unit of quantity.	Actual and computed ad valorem rate.
Fiscal year:		Pounds.				Per cent.
1914	35 per cent ad val.	11,145	$2,292	$796	$0.161	
1915	do	14,000	5,135	1,969	.352	
1916	do	13,000	2,965	1,002	.165	
1917	do	5,110	4,356	1,525	.793	
1918	do	14,318	8,775	3,021	.734	
Calendar year:						
1918	do	8,530	5,500	1,925	.645	
1919	do	4,000	4,800	1,680	1.330	
1920	do	10,150	7,500	2,625	.962	
1921	do	11,110	11,165	3,905	.779	

In comparison with domestic production these imports are of small importance. In the calendar years 1920 and 1921, although imports were in much larger volume than during the average of the period covered, they were at an annual rate of considerably less than 1 per cent of the estimated domestic production of 1,000 to 1,500 tons.

According to the trade, these imports come principally from England and Germany.

PRICES.

The following table shows the July prices, per pound, on standard grades of reinforced paper from 1914 to 1921.[1]

July—	K860—40 inches.	K1660—40 inches.	July—	K860—40 inches.	K1660—40 inches.
1914	$0.085	$0.099	1918	$0.111	$0.
1915	.086	.089	1919	.111	
1916	.089	.109	1920	.111	
1917	.158	.135	1921	.111	

[1] Furnished by the Angier Mills, Ashland, Mass.

TARIFF HISTORY.

loth lined or reinforced paper was first separately mentioned in act of 1913, at a duty of 35 per cent ad valorem.

COMPETITIVE CONDITIONS.

here is practically no foreign competition. As pointed out above, orts in the calendar year 1920, although considerably above the rage of preceding years, were less than 1 per cent of domestic pro-tion. A comparison of domestic prices with those of imported h-lined paper since 1914 shows the average price of the imported duct in each of the years named to be much higher than the quo-ons on standard domestic grades. This indicates that imports sist mainly of high-grade specialties which hardly come into com-ition with the domestic grade.

PHOTOGRAPHIC AND BLUE-PRINT PAPER.

General Information.

ct of 1913, paragraph 324: * * * albuminized or sensitized paper or paper rwise surface coated for photographic purposes, 25 per centum ad valorem; plain c papers for albuminizing, sensitizing, baryta coating, or for photographic or r printing processes, 15 per centum ad valorem.

DESCRIPTION.

Two groups of paper are included in the above tariff designation, photographic and platinum paper and (2) blue-print and brown-nt paper. Each of these in turn is divided into two kinds, (1) the aw" paper, which is practically the same as high-grade writing per, and (2) the finished paper which is the "raw" paper after it s been sensitized for printing by photographic, blue-print, or brown-nt processes.

As the names imply, these are the kinds of light-sensitive paper on ich photographs, photostats, blue prints, and other similar forms prints are made.

There are two kinds of raw photographic paper, namely, single-ght and double-weight. The single-weight papers, which are tally of higher quality, weigh from 27 to 36 pounds per ream of sheets 18 by 23 inches. They are often sold on the weight basis one sheet one meter square, a common weight for a sheet of this being 110 to 115 grams, or about 31 pounds on the above-named m basis. The double-weight papers vary from 235 to 260 grams sheet of one square meter, or from 64 to 74 pounds per ream of sheets 18 by 23 inches.

The finished photographic paper is sold also in single and double ght, in sheets of an immense variety of dimensions. It is also d in rolls. Finished blueprint paper is usually sold in rolls con-ning paper 50 yards in length and 30, 36, 42, or sometimes 54 hes in width. There are three weights of the paper. The two st common weights are, on the basis of a ream of 500 sheets 17 by inches each, the 17-pound weight, used for mailing purposes, and 24-pound weight, used for ordinary shop purposes. Also, a

...graphic paper, on the above ream basis, is made for the use o... architects, construction concerns, and others who do much work i... the open air.

It is suggested that inasmuch as the albuminizing process is obso... have the words "albuminized" and "albuminizing" be omitted from... the tariff law.

DOMESTIC PRODUCTION.

MATERIALS.

...New photographic paper must be made from ... which unite in a uniform texture throughout, if the pape... what be termed a "clear look through." e cheaper grades range ordinarily from 50 to 70 per cent sulphite. e most important commercial grade is of rag and sulphite in equal portions.

The blue-print paper imported from Germany consisted of 50 per t cotton rag and 50 per cent sulphite pulp. The French paper, made in the Johannot mills, is a better grade, consisting either all linen-rag stock or of linen and cotton rags mixed.

Blue-print paper, like photographic paper, must be sized to pre- nt undue absorption of the liquids used in the sensitizing and nting processes. Various kinds of sizing, particularly glue and in, are used for this purpose. Fillers, such as china clay and c, are also employed to some extent.

The materials used in sensitizing the raw paper are extremely ried as each concern which carries on this process uses its own vate formula. The principal ingredients are potash salts and iron ts. Some of the chemicals used are citrate of iron, red prussiate potash, ammonia, iron ammonium citrate, oxalic acid, citric acid, ric oxide, and ferric ammonia oxalate.

EQUIPMENT.

Photographic paper.—The raw paper is produced on machines like ose used to make fine paper (see Tariff Information Survey M–6). the United States the business of putting a sensitive coating on e raw paper is limited in extent and individual requirements, and ecifications for machines differ so that no standard coating machines r regular supply to coating mills are manufactured. The ma- inery used in sensitizing paper has, as a rule, been developed in the ant in which it is used. In a number of cases the concerns using design and manufacture it themselves, though some companies at manufacture wall-paper printing machines and machines for eparing so-called surface-coated paper also manufacture sensitizing achines for sale.

Baryta-coating machinery is practically the same as that used in ated-paper mills.[1]

Some sensitizing machinery is imported from Germany and Eng- nd, notably the Meisenbach machines made in Germany and the ott machines made in England. It appears to be a matter of inion whether the domestic or the imported machinery is the tter.

Blue-print paper.—As in the case of photographic paper, the raw ue-print paper is produced with the same kind of equipment that is ed in making fine writing paper. It is usually made in writing- per mills. The blue-print coating machines are entirely American ade, often designed and manufactured by those who use them. far as is known only one firm in the United States builds them for le to coating mills, and the business of this company is said to be ainly with concerns manufacturing blue-print paper for their own e and not for sale.

Several concerns in Germany construct coating machines for sale manufacturers of blue-print paper; one American manufacturer blue-print paper states that blue-print paper sensitizers in this untry can build their own machines for much less than the cost of nstruction of the German machines.

[1] See section on surface-coated paper, p. 1.

METHODS OF PRODUCTION.

Photographic paper.—Raw photographic paper is made in pra cally the same way and of the same materials as high-grade writ or book paper, except that more care must be exercised in remov foreign matter from the rags and other materials used. Each ma facturer usually has his own trade secrets, i. e., certain formulæ beater "furnish" and certain processes differing in detail from cesses of other manufacturers.

The raw paper undergoes two successive processes—baryta coa and sensitizing—before it is ready for purposes of photograp The baryta coating solution consists of barium sulphate held in pension in a solution of high-grade gelatin containing some for dehyde for hardening purposes. This solution is put on by bru rubbing back and forth across the grain of the paper. It is then d by passing it in festoons through a blast of hot air, smoothed polished by a calendering process, and wound up in rolls. The p ess is similar to that of coating paper for use in halftone print which is described in another section of this report. The mach used in making the highest grades of coated book paper could, a few modifications, be used for coating paper with baryta for tographic purposes.

The sensitizing process consists in applying to the baryta-co paper a warm emulsion, the composition of which is the trade se of each sensitizing concern. The emulsion is made up principall sensitive silver salts and gelatine; chrome alum is added to har the gelatin. Dyes are introduced in order to make the emul sensitive to certain colors. The paper is allowed to float on to the emulsion without dipping in. It is then led through a refriger box or passed over a chilling roll to cool the emulsion. The remai moisture is removed by passing the paper in festoons or on a zontal conveyor through conditioned air to dry the coating. albuminizing process went out of use about 20 years ago.

Blue-print paper.—The raw blue-print paper, like the raw ph graphic paper, is produced by the same processes as high-g writing paper and book paper, except that it is specially sized this purpose. Two kinds of paper are usually made into blue pr a heavy paper used for shop purposes and a thin or medium p used for mailing and filing. The former is practically the same ledger paper, and the latter similar to a bond paper. (See T Information Survey M–6 on Fine Paper, pp. 10, 11.) The raw p is cut into rolls varying in width from 24 to 54 inches, and in we from 140 to 300 pounds.

In the coating mill the raw paper as received from the p mills is put on the coating machine, where it runs over one or coating rollers, being coated with blue-print solution on one side The solution consists of the chemicals named under the hea "Materials" (see p. 22). From the coating rollers the paper through a dry box and reaches the other end of the machine pletely dry. It is then wound in rolls in 10 to 100 yard length cut into sheets, in which forms it is marketed.

GEOGRAPHIC DISTRIBUTION.

Raw photographic and blue-print paper is produced principally in ssachusetts and New York. The production of the finished paper nuch more widely distributed. New York, Massachusetts, Penn-vania, and Illinois are the main States manufacturing it.

HISTORY OF THE INDUSTRY.

Sensitized photographic paper has been made in the United States 35 years or more. The American Photographic Paper Co. was first to make raw photographic paper. It began manufacture in)1. Up to the outbreak of the European war, however, a large)portion of the raw photographic paper used by sensitizers in the ıited States was imported. The domestic industry was stimulated ring the war by need for photographic paper in the Government, well as in the commercial world, and because of the fear that im-rts would be cut off. Several mills made a paper for this purpose, t it was not entirely satisfactory.

DOMESTIC PRODUCTION AND CONSUMPTION.

Photographic paper.—No figures are obtainable for total production raw or sensitized photographic paper. A rough estimate places r yearly output of raw photographic paper at 10,000,000 pounds, th an average annual value during the war of $3,000,000. At cer-n times during the war, however, notably in 1918, it is probable at the production considerably exceeded 10,000,000 pounds. It is t unlikely that at the present time (1921) the output is in excess of ,000,000 pounds, for one concern alone reports an annual produc-n of 6,000,000 pounds. Nevertheless, production is undoubtedly ıaller than it was during the war, for at least one concern which ınufactured raw photographic paper during the war has now ısed making it.

Because of the lack of accurate production figures, it is impossible estimate satisfactorily what proportion the domestic output repre-nts of the total raw photographic paper used each year in the ıited States.

Blue-print paper.—No figures are available for production of raw ıe-print paper. The annual output of sensitized blue-print paper the United States is variously estimated by sensitizers at from)00 to 10,000 tons.

DOMESTIC EXPORTS.

Figures for domestic exports of photographic and blue-print paper e not separately shown by the Department of Commerce. Data pplied by manufacturers indicate that practically no raw photo-aphic paper is exported from the United States. One large sensi-ing concern making raw photographic paper exports to its own ctories in Canada, Europe, and Australia. However, in sensitized ıotographic paper, the United States has an important export ısiness, sending shipments all over the world. There is no evidence at appreciable quantities of raw blue-print paper are exported. ıe export trade is handicapped by the fact that this sort of paper ter a short time deteriorates in quality. One company estimates

that not over 1 per cent of the finished blue-print paper manu tured on the Atlantic and Pacific coasts is exported. The s amounts exported go principally to Canada, Latin American c tries, and the Far East, practically none going to Europe.

FOREIGN PRODUCTION.

Germany and France are the most important foreign produce raw photographic and raw blue-print paper. Our principal c petitors in sensitized photographic paper are England, Belgi and Germany. Foreign production of sensitized blue-print pap of little concern to the domestic industry, for the United St produces practically all that it uses.

IMPORTS.

In the import statistics by countries of origin raw and sensit photographic and raw and sensitized blue-print paper are gro under the heading "photographic paper" (see table, p. 31). to the war our total imports of photographic paper of this ge description averaged a little above $1,000,000 per year. After they decreased, the lowest amount in any year being $143,27 the calendar year 1919. Figures for quantities were first colle in 1919. Total imports in 1920 (1,198,320 pounds) were more t three times the 1919 figures, and imports in 1921 were 1,899 pounds.

In each year from 1910 to 1915 Germany supplied more than our imports of photographic paper; France was the next largest tributor. Belgium and the United Kingdom were third and fo respectively. During the later years of the war France was the country that sent us photographic paper in any quantity. In Germany had again become important as an exporter of photogra paper to the United States, sending us shipments of a greater v than those received from any other country.

In the statistics of imports for consumption raw photogra paper is separated from the sensitized, but blue-print paper is distinguished (see p. 31). The figures for the sensitized pa however, represent almost exclusively photographic paper as dis from blue-print paper, as imports of the latter amount to practi nothing.

Imports of plain basic photographic paper for albumini sensitizing, or baryta coating for photographic or solar prin process (which includes raw photographic and raw blue-print pa averaged over 4,000,000 pounds per year from 1910 to 1916. largest amount, 5,826,241 pounds, was imported in 1914. Imp decreased rapidly after 1916, reaching a low level of 251,588 po in the calendar year 1919. In 1920 they increased to 641,663 pou and in 1921 to 951,472 pounds.

Figures for the imports for consumption show that in genera have imported sensitized paper of considerably smaller value that of the raw paper imports. Measured quantitatively, imp of sensitized paper, as compared with those of raw paper, have even smaller than the comparative values would indicate. (Quan figures were not compiled until 1919.) From 1908 to 1915 imp of sensitized photographic paper averaged about $450,000 per an

fter 1915 they decreased to almost nothing in 1918; they have vived somewhat, however, since 1918, although they are still much elow the pre-war levels. The raw photographic and blue-print aper comes mainly from Germany and France, and the sensitized notographic paper from England, Belgium, and Germany. As ated above, practically no sensitized blue-print paper is imported.

PRICES.

PHOTOGRAPHIC PAPER.

Raw.—Prices at different dates from January, 1912, to June, 1921, n both the domestic single weight and double weight raw photo-raphic papers, as furnished by a manufacturer, are given below. he quotations on single weight paper apply to paper in reams of 30 sheets, 18 by 23 inches, weighing from 27 to 36 pounds per ream, nd the quotations on double weight paper to paper in reams of the ame number of sheets and size of sheet weighing 72 pounds per ream. he prices given are f. o. b. mill.

Date.	Single weight.	Double weight.
	Per pound.	*Per pound.*
nuary, 1912	$0.23	[1]
ebruary, 1917	.30	$0.25
ovember, 1918	.31	.30
ne, 1920	.35	.30
ne, 1921	.32	.29

[1] Price not furnished. Probably was from 1 cent to 3 cents lower than the single-weight price.

The prices of raw photographic paper fluctuated much less during he war and after than did the prices of most other kinds of paper. n July, 1921, the price of the domestic paper was not much above re-war levels. Consumers of imported raw photographic paper say hat they pay little more for their paper than they did prior to he war.

Sensitized.—The 1914 prices on certain standard sizes and grades f sensitized photographic paper are compared in the following table vith their prices in July, 1921. The prices given are the manufac-urers' catalogue list prices.[1]

Grade and size.	1914		July, 1921.	
	Single weight.	Double weight.	Single weight.	Double weight.
Velox:	*Per gross.*	*Per gross.*	*Per gross.*	*Per gross.*
4 by 5 inches	$2.00	$2.50	$2.30	$2.90
5 by 7 inches	3.50	4.40	3.90	4.90
8 by 10 inches	9.00	11.25	9.00	11.25
11 by 14 inches	17.50	21.90	17.00	21.25
Azo:				
4 by 5 inches	1.00	1.25	1.35	1.70
5 by 7 inches	1.75	2.20	2.30	2.90

11 by 14 inches	8.00	10.00	10.00	12.50

[1] Furnished by Eastman Kodak Co.

It will be noted that prices in July, 1921, were very little higher than in 1914; in one case the July, 1921, price is lower than the 1914 price. An unusual feature in the situation is that the price list of 1914 remained operative up to October, 1919. In other words, there was no increase during the war. The increase made in 1919 averaged 22.3 per cent for Ano and 19.8 per cent for Velox. From October, 1919, to the present time (November, 1921) there has been no increase.

BLUE-PRINT PAPER.

The prices furnished by different sensitizers of blue-print paper show a great variation in the tendencies of the prices of different commodities during and since the war. The following table shows the prices charged by one manufacturer to consumers for finished blue-print paper of 50 per cent rag stock in 50-yard rolls of three standard widths:

Year.	Width.		
	Inches.	Inches.	Inches.
	Per sq.	Per sq.	Per sq.

ed nearly 29 per cent. The 1913 rate was 15 per cent. However, ar conditions obscured the effect of the lowered tariff, and it is im- ssible to say whether or not the decreased rate would have resulted increased imports had conditions remained more nearly normal. actual fact, imports of plain basic paper fell off sharply during e war.

COMPETITIVE CONDITIONS.

Sensitized blue-print paper.—In considering competitive relations ith foreign countries, sensitized blue-print paper may be left out of nsideration as it is imported in only negligible amounts. One rea- n for this is the same fact that partially accounts for the absence of ports of this commodity, namely, that it quickly deteriorates with e. Another reason, as given by a domestic manufacturer of sensi- ed blue-print paper, is that the raw paper of the cheaper grades ade in the United States costs the sensitizer less than European per of the same quality sells for. What small quantities of finished ue-print paper are imported are of the higher grades.

Raw blue-print paper.—The manufacturer quoted on the absence foreign competition in sensitized blue-print paper, states also that ports of raw blue-print paper are too limited to be of concern to merican manufacturers of the raw paper. He adds that the raw per import is of a quality and finish that is not procurable in the nited States and is imported only for certain special purposes. On e other hand, a manufacturer of raw blue-print paper states that nce the war the influx of foreign paper at a low price has cut mate- ally into his business.

Raw photographic paper.—Foreign competition is much more rious, however, in the photographic paper industry. Before the ar the imports of raw photographic paper were probably a con- derable proportion of the total paper sensitized, apparently run- ng sometimes as high as one-half. When war conditions caused decline in imports, a number of plants were constructed to meet e deficiency. These new plants, and naturally the old ones too, e seriously menaced by a renewal of the old import trade, for the mbined capacity of the present mills plus a possible pre-war scale imports would be more than enough to supply the domestic mand. Apparently thus, a portion of the domestic trade or a rtion of the import trade must be sacrificed, and upon the deci- on as to which depends the amount of duty that should be placed the raw photographic paper.

It may be of significance to analyze the arguments set forth by oducers and consumers of raw photographic paper. A concern at for many years prior to the war made raw photographic paper ys that immediately following the reduction in duty in 1913, reign competition began to be formidable, and but for the war ould have driven it out of business. It says that at the present wer foreign prices, if the duty remains unchanged, it will have to ose its mills. A company which undertook the manufacture of raw hotographic paper during the war has entirely ceased making that nd of paper, stating that its war-time customers are returning to reign sources of supply because the American cost of production is gher than the price of the foreign paper delivered in the United tates. A large concern which sensitizes all or a large part of its tput also states that the American cost of production of raw paper

is higher than the price of the foreign paper delivered in the United States. All the companies referred to desire to have the American product protected, their contention being that the American raw paper is satisfactory to the American consumer.

This contention, however, is contraverted by a large sensitizing firm that does not make its own raw paper. It maintains that the American product, as far as it is sold to sensitizers, is not so good as the imported paper, and that whatever the duty, it must continue to import raw paper if the quality of its product is to be kept up. The following reasons are assigned for the inferior quality of the domestic product: (1) The water available in this country is not so good for the purpose as that available in Europe; (2) linen rags and other raw materials are more easily obtained in Europe; and (3) the art of raw photographic paper making has not been developed as far here as in Europe, and the workers in the mills have not had as careful training. The same company states that it has failed to interest American mills in attempting to produce paper of the quality produced in Europe.

The truth seems to be that in the United States, in the photographic paper industry as in other lines of business, it ordinarily brings higher returns, for a given amount of capital, to maintain a large output of medium-grade products than to maintain a small output of high-grade products.

American manufacturers generally agree that in regard to water the United States, particularly New England, is at no disadvantage as compared with Europe. On the other hand, it is asserted in other quarters that foreign manufacturers of raw photographic paper have uniformly refused, because of the unsuitability of the water, to establish mills in the United States. The European advantage of more easily obtainable rags and other raw materials may very likely make possible a somewhat lower cost of production, but not necessarily a superior quality of product. Advantages in training and skill of workers and superior technique are hard to overcome, but they can be surmounted if American manufacturers will make the effort.

Summing up the situation, it may be said that whatever the comparative quality of the domestic and imported raw photographic paper, the advantage of lower cost of production is likely to be with the European mills for some time to come, and that because of increased equipment installed during the war a return of imports to their pre-war volume might seriously embarrass the domestic industry.

Sensitized photographic paper.—Foreign competition in sentitized photographic paper is apparently not so keen an issue as in the raw paper. The proportion of imports to domestic production is considerably less than in the case of the raw paper, for not only is domestic production of sensitized paper greater, but the absolute quantity of imports (though not always the value) has in the last 13 years probably been much less than the quantity of imports of raw paper, although, as stated above, import figures for raw photographic and raw blue-print paper can not be separated.

A large manufacturer of sensitized photographic paper says that protection for the American sensitizing industry is needed because Germany can produce it at a lower cost. The main reason assigned for the difference in cost is that most of the sensitizers in this country are to a large extent dependent on imported raw paper, barium sulphate

gelatin, on account of the fact that the qualities of these materials ded are not available to sensitizers in this country. The German nufacturer, on the other hand, can secure these materials cheap his own country. The lower cost of labor in Germany and the external value of the mark compared with its value inside Ger- ny also aid the German in marketing his paper in the United tes.

CIGARETTE PAPER.

GENERAL INFORMATION.

[illegible] cigarette-book covers [illegible] and cigarette paper [illegible] in volume and value.

DESCRIPTION AND USES.

Cigarette paper [illegible] used in making cigarette[illegible] [illegible] the greater [illegible] [illegible] white paper.

It is suggested that cigarette paper, along with cigarette book[illegible] [illegible] from its present location in [illegible] [illegible] to the paper schedule.

DOMESTIC PRODUCTION.

MATERIALS.

The pulp used in manufacturing cigarette paper is ordinarily made rom flax and hemp products. These are secured principally from orthern France and Belgium, also England, Germany, and Holland. ussia is normally one of the most important flax-producing areas f the world, but at the present time is of no importance as a source f flax for the cigarette-paper mills of other countries.

In the past it has been easier for European mills, which are located ainly in Austria and northern France, than for American mills to ecure these raw materials for cigarette-paper making. The reason r this is the greater proximity of the European mills to the source f supply. Hemp sailcloth and cordage have been much used as aw materials by these mills. So far the United States has been rced to import the greater part of its materials for cigarette paper. t is possible, however, that the seed flax of the northwestern part f the United States may be developed to provide adequate domestic upplies of pulp for cigarette paper.

The only other material used in any quantity is a fine grade of halk, usually in the form of calcium carbonate or magnesium carbonate. This is used as a filler. The greater part of that consumed n cigarette-paper making in the United States comes from England, hich has large supplies of chalk of a high quality.

EQUIPMENT.

The cigarette-paper manufacturing industry of the United States s so limited in extent that very little machinery is used, compared ith the quantities of machinery engaged in making other kinds of aper. What is used is mainly of domestic production. Wires and andy rolls, however, used on cigarette-paper machines are largely mported from France and England, as manufacturers say it is practically impossible to get them properly made in the United States.

METHODS OF PRODUCTION.

The processes of cigarette-paper manufacture are in a general way he same as those of making other kinds of paper. (See Tariff nformation Survey M–2 on Printing Paper.) The linen or hemp is laced in the beater after being reduced to "half-stuff" by means of oiling. In the beater the individual fibers are separated, filler in he form of chalk is added, and the whole mass beaten until it is horoughly homogeneous. The skill shown by the men tending the eaters is one of the principal factors in cigarette-paper manufacture. The superiority of the foreign over the domestic brand of cigarette aper is due largely to the greater amount of time and energy that oreign manufacturers give to making the pulp the right consistency or the paper machine.

The paper machine used is the Fourdrinier model, designed especially for making cigarette paper, usually with imported wires and andy rolls.

HISTORY OF THE INDUSTRY.

Up to 1914 no cigarette paper in bobbins was manufactured in the United States. The only kinds manufactured here were the cheaper grades formerly given away in small books to encourage the sale of well-known brands of smoking tobacco. The imports of cigarette paper amount to very little. In the fall of 1914, when it looked as if importation might be stopped by war conditions, certain American paper manufacturers undertook to produce cigarette paper. New buildings and machinery were installed. Costly experiments had to be made on account of the lack of familiarity with the processes involved.

DOMESTIC PRODUCTION AND CONSUMPTION.

According to Lockwood's Directory of the Paper and Allied Trades, five concerns were equipped for making cigarette paper in 1920. Apparently, however, only one of these companies, located in Massachusetts, produces it in quantities of commercial importance.

The following tabulation shows the estimated annual production of cigarette paper in the United States from 1918 to 1920:

Year.	Amount.	Value.
	Pounds.	
1918	2,033,000	$2,000,000
1919	1,620,000	1,600,000
1920	2,219,000	2,200,000

This production represents roughly from one-fifth to one-third of the total cigarette paper used in the United States, the remainder being imported.

DOMESTIC EXPORTS.

Exports of cigarette paper from the United States are practically negligible.

FOREIGN PRODUCTION.

Figures for the production of cigarette paper in other countries are not obtainable. Southwestern Europe, particularly France, is the most important cigarette-paper producing region, from the point of view of competition with the United States.

IMPORTS.

Imports of cigarette paper in rolls amount to about 4,000,000 pounds per year, representing two-thirds or more of domestic consumption and from two to four times domestic production.

Statistics for the quantities of cigarette paper imported by countries are not available. Beginning with 1913, however, figures for the value of cigarette books, covers, and paper imported into the United States by countries of origin have been compiled.

The value of imports of cigarette books, covers, and papers increased steadily from $706,830 in the fiscal year 1913 to $8,830,018 in the calendar year 1918. Since 1918 each year has witnessed a successive decline in value. In the calendar year 1920 imports

nounted to $4,723,995, and in 1921 to $3,579,643. How much at all) the actual quantity of cigarette paper imported into nited States increased between 1913 and 1918 and declined after 18 is a matter of conjecture. Both the pre-war and the present ices of imported cigarette paper were so much lower than the ar price, that the figures for value of imports do not necessarily ove definitely that the quantity of imports increased during the ar.

France before the war was by all odds our most important source cigarette paper and has held her supremacy. Prior to the war, ustria was also of considerable importance, but since 1915 has unted for little in our import trade in cigarette paper. Italy, ortugal, Spain, and England have sent small amounts, and even pan in certain years has sent shipments amounting in value to veral thousands of dollars. However, since Austria ceased to be a urce of supply for the United States, an average of more than 95 r cent of our imports of cigarette paper has come from France.

PRICES.

The prices quoted below refer to the highest grade of linen cigarette per in bobbins for machine-made cigarettes.

Prior to the war foreign cigarette paper sold in this country for out 20 cents per pound duty paid. During the war it reached as gh as $2 per pound in France or $3 per pound duty paid in the nited States. According to American manufacturers, it was uoted in August, 1921, at about 35 cents per pound in England and rance or somewhat less than 60 cents per pound duty paid in the nited States, with Germany, Italy, and Japan offering it even eaper, in fact at almost any price obtainable.

According to the trade, domestic cigarette paper was quoted in ugust, 1921, at about 70 cents per pound and never at any time as sold above $1 per pound.

TARIFF HISTORY.

Cigarette paper bore a duty of 70 per cent ad valorem under the ct of 1890, 50 per cent under the act of 1894, 60 per cent under the cts of 1897 and 1909 and bears a duty of 50 per cent under the act f 1913.

COMPETITIVE CONDITIONS.

It has been pointed out that imports of cigarette paper are from wo to four times domestic production, and that our export trade cigarette paper is practically nonexistent. Only one company the United States manufactures cigarette paper in amounts f commercial importance. It is fairly patent that the domestic igarette-paper industry does not compete on even terms with the dustry abroad.

Although certain American manufacturers assert that American igarette paper is fully equal in quality to French or other imported igarette paper, they run counter to an opinion which maintains strong hold among manufacturers of cigarettes in the United States. large tobacco concern states:

rt of our materials. The price of them, particularly linen fiber, s been higher to the American consumer than in Europe, where ey are produced, owing to higher transportation, embargoes, and her factors. There is little question also that paper-mill wages e much lower in France and other European countries than in the nited States. Manufacturers point out that wages are a much more portant factor in the total cost of production of expensive papers e cigarette paper than in that of cheap papers.

Exact and detailed figures for comparative costs of cigarette-per production here and abroad are not available.

COURT AND TREASURY DECISIONS.

Paper differing from cigarette paper by containing less magnes
was held to come within the provision in paragraph 459 in the a
of 1897 for cigarette paper in all forms. The court said that on
it appears an article is cigarette paper in fact its classification c
not be changed by devoting it to another use; it is still cigaret
paper. (Hygeia Antiseptic Toothpick Co. *v.* United States, 1 (
Cust. Appls., 497 of 1911.)

PAPIER-MÂCHÉ.

GENERAL INFORMATION.

Act of 1913, paragraph 369: * * * manufactures of * * * papier-mâché, * * or of which these substances or any of them is the component material of ief value, not specially provided for in this section, 25 per centum ad valorem * *.

DESCRIPTION AND USES.

Papier-mâché is a hard, tough and plastic substance, generally ade from pulped waste paper, mixed with mineral matter such as ina clay, and rosin, or from sheets of paper glued and pressed gether. It is moulded when moist by steel dies into architectural naments, lacquered boxes, trays, durable utensils, dress forms, indow dummies, signs, figures, toy animals, other kinds of toys, nd other articles.

As it is made from the same general sort of material as paper, it ight be well to transfer it to Schedule M, perhaps naming it in connection with filter masse (par. 321) and indurated fiber ware (which now in the sundries schedule, par. 355). These three commodities re similar in that they are wares made through the moulding of pulp r fiber.

DOMESTIC PRODUCTION.

Materials.—Papier-mâché is made out of waste paper, cotton nters, or rags colored with aniline dyes. Glue, paste, rosin, and ther sizing materials, oil, clay, and the like are also used. These aterials are obtained principally in the United States.

Equipment.—The machinery used is made principally in the Jnited States.

Methods of production.—One firm reports that it makes papier-âché articles by pressing paper pulp or softened paper into molds, ither by machinery or by hand. So-called papier-mâché board, sed as an intermediary material in the manufacture of papier-âché objects is made on a cylinder paper machine, the same as rdinary box board. (See Tariff Information Survey M–1, on Building Paper, Paper Boards, and Filter Masse.)

Amount of output.—One estimate places the average annual domestic production at 5,000 tons, valued at $250,000.

Domestic exports.—No figures are available.

IMPORTS.

A manufacturer in the United States states that papier-mâché is mported from Germany, France, and Austria-Hungary. Imports y countries are not separately compiled by the Department of ommerce. The following table shows imports for consumption rom 1908 to 1921:

IMPORTS FOR CONSUMPTION—REVENUE.

1921	do	42,460	10,615	

TARIFF HISTORY.

Manufactures of papier-mâché were dutiable at 35 per cent a valorem under the act of 1890 (par. 461); 30 per cent ad valorem under the act of 1894 (par. 353); 35 per cent ad valorem under the act of 1897 (par. 450); and 35 per cent ad valorem under the act of 1909 (par. 464). They are dutiable at 25 per cent ad valorem under the act of 1913 (par. 369).

COMPETITIVE CONDITIONS.

A manufacturer in the United States states that in many instances papier-mâché has recently been imported into the United States at a price less than the American cost of production.

Using the rough estimate of $250,000 as the average annual value of papier-mâché production in the United States, imports constitute in the neighborhood of one-tenth of domestic production.

if **value, not** specially provided for in this section, 25 per centum ad

4. * * * bags, envelopes, and all other articles composed wholly
e of any of the foregoing papers, not specially provided for in this sec-
xes of paper or papier-mâché or wood covered with any of the foregoing
red or lined with cotton or other vegetable fiber, 35 per centum ad

32. Papers or cardboard, cut, die cut, or stamped into designs or shapes,
s, monograms, lace, borders, or other forms, * * * 25 per cent ad

DESCRIPTION.

ve items include various miscellaneous manufactures of paper board or cardboard. The kinds of paper referred to ph 324 as the "foregoing papers" are surface-coated papers, apers, decorated papers, cloth-lined papers (all of the fore- cribed elsewhere in this survey), and parchment and imita- hment papers (described in Tariff Information Survey

is no separate provision for paper bags and paper boxes, n the specialties described above. Inasmuch as paper bags es are among the most important staple articles made of the United States, it would seem desirable to name them lly in the tariff law. Probably some such wording as "bags, d wholly or in chief value of paper, n. s. p. f.; boxes composed or in chief value of paper, papier-mâché, or paper board, f.," would be appropriate.

DOMESTIC PRODUCTION.

ppended table (p. 44) shows the production of paper bags and nd paper boxes in the United States in census years from 1904 9. The boxes produced by the establishments reporting are nd metal-edged boxes, made of paper, newsboard, or cardboard, ntainers for confectionery, millinery, small cigars, cigarettes, ther articles. Cartons, folding boxes, mailing cases, shipping s, charlotte-russe boxes, holders, and bonbon cups are among rticles reported. Although paper and wood pulp are the ipal materials, the products also include lithographed, lacquered, lain tin boxes, tea caddies and canisters of tin, and fancy boxes ood covered with cretonne, silk, tapestry, and similar textiles. nown in the table more than 98 per cent of the 1914 production ncy and paper boxes consisted of paper boxes and cartons.

DOMESTIC EXPORTS.

xports of paper bags from the United States increased from 6,799 in the fiscal year 1913 to $2,593,459 in the calendar year 0, but fell to $846,909 in the calendar year 1921. Cuba is much most important market. Canada, British South Africa, Mexico, d Panama are next in importance. In 1914 exports amounted to s than 3 per cent and in 1919 to slightly more than 3 per cent of mestic production.

Paper boxes and cartons have been exported in nearly the same alues as paper bags, increasing from $553,021 in the fiscal year 1913

[illegible] 36 [illegible] 1930. [illegible] they amounted to [illegible] the most important market, receiving from [illegible] of the exports that year from [illegible] in 1930. Cuba, [illegible] Japan, [illegible] Kingdom import considerable quantities [illegible] paper hangings.

[illegible] imports of paper hangings amounted to less [illegible] of the domestic production.

Notes

[illegible] paper hangings other than fancy and [illegible] with special kinds of paper, are not [illegible] separately [illegible] imports for consumption [illegible] in the tariff law.

COURT AND TREASURY DECISIONS.

and manufactures of paper have been distinguished in cases. In a Supreme Court case under the act of 1883, ted, colored, and embossed to imitate leather, or coated to imitate velvet, were held not to be manufactures of e court declared that the manipulation or treatment of paper in the completed condition in which produced at a by mere surface coating and processes not changing its only increase the uses to which such paper might be put cause the paper to cease to be paper and become a manu- aper. (Dejonge *v.* Magone, 159 U. S. 562.)

tute a material paper it is not necessary that the machine nanufacture shall be known as a paper-making machine. material shall contain glue, alum, and clay. (Germania o. *v.* United States, 2 Ct. Cust. Appls., 55.)

er, stamped by a single operation into shapes with lace- known as tops or doilies, and used to put on top of candy, fruit, etc., or under finger bowls, was held not to to be paper and become a manufacture of paper under 97. (Hamilton *v.* United States, 167 Fed. [illegible] ates *v.* Hensel, 152 Fed. 578, of 1907, holding lace paper s, tops, etc., some printed with the names and addresses and used in packing confectionery, etc., to be dutiable res of paper rather than as paper or as printed matter t.)

Paper bags with incidental printing thereon were held to be manufactures of paper within paragraph 407 of the act of 1897. (Kraut *v.* United States, 130 Fed. 392.)

So-called duplex lithographic transfer paper used in transferring decalcomania designs to pottery, and produced by pasting together two sheets of paper, one coated with a gummy substance and the other uncoated, was classified as paper rather than as manufactures of paper under the act of 1897. (Drakenfeld *v.* United States, 167 Fed. 798.) For other decisions upon such paper see "Surface-coated paper."

Metal-coated paper cut into strips, each about 2½ feet long and one-fourth of an inch wide, embossed with a small ornamental design and with the letters "P" and "T" left attached to a very narrow border at each end for convenience in handling, used for fancy wrapping around candy boxes or similar packages, are not merely strips of paper. In other words, strips of paper made up so that nothing remains to be done to them before using but to detach their ends were held to be so far advanced in condition that they were no longer simply paper, but had become manufactures of paper. (Kupfer Bros. *v.* United States, 7 Ct. Cust. Appls. 86, of 1916.)

Figures of women wearing fashionable clothes, drawn on cardboard with pen and ink or pencil and colored with water colors, designed to illustrate the clothes, were held to be exempt from duty under paragraph 652 of the act of 1913 as "original drawings and sketches in pen and ink or pencil and water colors" rather than dutiable as manufactures of paper under paragraph 332. Similar cards, composed in large part of actual dress goods fabrics and other similar cards representing the interiors of rooms exhibiting designs of drapery, pictures of wall paper and linoleum designs, bolts of dress or upholstery fabrics, a couch with figured covering, and similar articles were held to be manufactures of paper and not exempt from duty as drawings or as works of art. (Macloughlin *v.* United States, 11 Ct. Cust. Appls. —, of 1920; T. D. 38261.)

The phrase "covered with surface-coated paper" in paragraph 405 of the act of 1897 was limited to fancy boxes covered with such paper, and plain ordinary pill boxes covered with surface paper were held not to be dutiable as fancy paper boxes. (G. A. 4182, T. D. 19488, of 1898.) But boxes composed of paper board and paper trimmed and ornamented with shells were held dutiable as fancy paper boxes under that act. (G. A. 4212, T. D. 19657, of 1898.) This decision, however, was modified upon evidence showing that similarly constituted boxes were in chief value of shells. They were accordingly held dutiable as manufactures of shell. (Abstract 3657, T. D. 25772, of 1904.) Fancy boxes made of papier-mâché were held not to come within the provision for fancy paper boxes because they were not made of paper. (G. A. 4973, T. D. 23197, of 1901.)

Paper boxes covered with embossed surface-coated paper were held dutiable under paragraph 411 of the act of 1909 and not under paragraph 418 by application of the rule that where two or more rates are applicable to any article it shall pay duty at the highest of such rates. (Woolworth *v.* United States, 1 Ct. Cust. Appls. 120, of 1910.)

Boxes covered with surface-coated paper and lined with silk, silk chief value, were held dutiable under paragraph 328 of the act of 1913 as against the Government's contention that they were dutiable as manufactures of silk under paragraph 318. (Abstract 39582, of

taken, T. D. 36524, affirmed in United States *v.* Park
pls. 422, of 1917; rehearing denied, Abstract 39804.)
es composed of cardboard and paper covered with
ınd lined with silk and cotton cloth (satin) with metal
ttons were held dutiable under the provision in para-
ıe act of 1913 for boxes of paper covered with cotton.
)8, of 1916.) Jewelry boxes composed of wood or
vered with cotton and lined with silk, silk in chief
lso held to come within paragraph 324. (Abstract
.) Also jewelry boxes with sides composed of wood
ıé and wood or wood covered and lined with cotton.
)8, of 1917.)
ood covered with surface-coated paper, wood chief
ld to come within paragraph 324 of the act of 1913

1915.)

PAPER STOCK.

General Information.

Act of 1913, paragraph 566: Paper stock, crude, of every description, including all grasses, fibers, rags, waste, including jute, hemp, and flax waste, shavings, old paper, rope ends, waste rope, and waste bagging, and all other waste not specially provided for in this section, including old gunny cloth and old gunny bags, used chiefly for paper making (free).

DESCRIPTION AND USES.

The tariff wording is self-explanatory. It is not possible to make a thorough differentiation of the various kinds of paper stock according to the finished paper into which they enter, for almost every kind of paper employs a great variety of raw materials. The principal kind of grass used is esparto grass, imported from Spain and Algeria. This grass makes a high-grade, light, fluffy book paper. It is little used in the United States, however, being consumed principally in the United Kingdom. Other grasses, such as saw grass from Florida, are of minor importance. There is probably no grass in existence that could not be made into paper if sufficient energy were expended on it, but most grasses yield too little cellulose to be commercially useful as paper-making material. "Fibers" is a general term applicable to anything of a fibrous texture. It should be emphasized, however, that except for some asbestos and negligible quantities of other fibers, only vegetable fibers are used. Rags enter into almost all kinds of paper except newsprint, wrapping, and hanging paper, although certain grades of a great many other kinds of paper contain no rags. They are not always absent from the kinds of paper mentioned. The best rags are new linen cuttings, although new cotton cuttings make an excellent quality of paper. New linen and rag cuttings have their most important use in making the best qualities of writing, bond, and ledger paper. Old rags of light color which have been carefully sorted and cleaned are much used in making writing paper, book paper, tissue paper, and all sorts of specialties. Heavy, coarse, colored rags are one of the important constituents of sheathing paper, roofing felt, and other coarse, heavy papers, and are used to some extent in making paper boards. Woolen rags are not used. Waste of jute, hemp, and flax and waste bagging and gunny cloth are often used to make a heavy, strong paper—for instance, manila wrapping paper. Old paper enters into paper of all kinds. Ninety per cent of the paper boards made in the United States is of waste paper. Building paper and felts and cheap wrapping paper also consume considerable amounts. Waste paper is used, usually in small proportions, in making book paper and other papers of relatively high quality. Straw is also used in appreciable amounts in the manufacture of paper board, and to some extent in making certain kinds of paper. Straw-board manufacture in Holland is a definitely developed industry.

SUGGESTED CHANGE IN TARIFF WORDING.

In the act of 1913 there is an item at the end of paragraph 408 in the free list which reads "and waste of any of the above articles suitable for the manufacture of paper." The articles referred to are

g for cotton, gunny cloth, similar fabrics, suitable for covering
, composed of a variety of materials, and plain woven fabrics
e jute yarns. This item appears to be a partial duplication of
ıph 566, the paper stock paragraph, and might be removed
rfluous. It is also suggested that in order to eliminate the
ity of free importation of bags which are still suitable for
ontainers, the following words be added at the end of paragraph
ıo longer suitable for bags."

DOMESTIC CONSUMPTION.

e at the end of this section (p. 55) shows the consumption of
ock in the United States by States in the census years from
914. No comprehensive figures are obtainable for later years.
idly increasing tonnage of waste paper used is the most
eature of this table. This is explained by the development
ıper board industry in the last few years. (See Tariff In-
ı Survey M–1, on Building Paper, Paper Boards, and
sse.) In 1904, 588,543 tons of waste paper were consumed
ited States. In 1914 the amount had increased to 1,509,981
1914 rags were next in importance, 361,667 tons being con-
In tonnage straw was next with 307,839 tons, and manila
with 121,170 tons. The value of the manila stock, how-
considerably higher than the value of the straw. Straw
r costs much less per ton than rags or manila stock because
r percentage of cellulose yield.
est amounts of waste paper are consumed in Ohio, Michigan,
, New Jersey, and Massachusetts. Massachusetts con-
nost rags; it is followed by Pennsylvania, Illinois, and Ohio.
Jersey, and Massachusetts are the most important manila-
ıming States. Straw is naturally consumed near the pro-
ters, for its cost of transportation per unit of cellulose
extremely high. Ohio, Indiana, and Illinois are the
h consume the greatest amounts of straw.

DOMESTIC EXPORTS.

ded table (see p. 59) shows the United States exports of
from 1910 to 1921. In the five years prior to the war
from 32,000,000 to 85,000,000 pounds per annum.
war the average was below 30,000,000 pounds, but after
orts increased to 84,666,468 in the calendar year 1920.
s depression of 1920–21 caused exports in 1921 to fall
,442 pounds.
t trade in paper stock has a wide market. From 1910 to
ıited Kingdom was much the most important foreign
American paper stock. Canada was second, Germany
ertain other western European countries followed. In
ports to the United Kingdom suddenly almost ceased,
since resumed. Since that time Canada, on the average,
more than half of our paper stock exports. Beginning
nsiderable amounts were shipped to British India and
Straits Settlements, while exports to western Europe
l. In following years an export trade of considerable

PAPER STOCK.

General Information.

Act of 1913, paragraph 566: Paper stock, crude, of every description, inc: grasses, fibers, rags, waste, including jute, hemp, and flax waste, shavings, rope ends, waste rope, and waste bagging, and all other waste not specially for in this section, including old gunny cloth and old gunny bags, used paper making (free).

DESCRIPTION AND USES.

The tariff wording is self-explanatory. It is not possible a thorough differentiation of the various kinds of paper stoc ing to the finished paper into which they enter, for almost e of paper employs a great variety of raw materials. The kind of grass used is esparto grass, imported from Spain and This grass makes a high-grade, light, fluffy book paper. I used in the United States, however, being consumed prin the United Kingdom. Other grasses, such as saw grass fro are of minor importance. There is probably no grass in that could not be made into paper if sufficient energy were on it, but most grasses yield too little cellulose to be con useful as paper-making material. "Fibers" is a general plicable to anything of a fibrous texture. It should be em however, that except for some asbestos and negligible qu other fibers, only vegetable fibers are used. Rags enter in all kinds of paper except newsprint, wrapping, and hangi although certain grades of a great many other kinds of pap no rags. They are not always absent from the kinds of p tioned. The best rags are new linen cuttings, although n cuttings make an excellent quality of paper. New linen cuttings have their most important use in making the bes of writing, bond, and ledger paper. Old rags of light co have been carefully sorted and cleaned are much used writing paper, book paper, tissue paper, and all sorts of Heavy, coarse, colored rags are one of the important co of sheathing paper, roofing felt, and other coarse, heavy p are used to some extent in making paper boards. Wool not used. Waste of jute, hemp, and flax and waste bu gunny cloth are often used to make a heavy, strong instance, manila wrapping paper. Old paper enters int all kinds. Ninety per cent of the paper boards made in States is of waste paper. Building paper and felts and c ping paper also consume considerable amounts. Wast used, usually in small proportions, in making book pape papers of relatively high quality. Straw is also used in amounts in the manufacture of paper board, and to som making certain kinds of paper. Straw-board manufactur is a definitely developed industry.

SUGGESTED CHANGE IN TARIFF WORDING.

In the act of 1913 there is an item at the end of parag the free list which reads "and waste of any of the ab suitable for the manufacture of paper." The articles ref

were shipped to [illegible]
while exports to [illegible]
ars an export trade of [illegible]

volume to the Dutch East Indies, Hongkong, the Philippines, and other eastern countries developed. Thus our export market during the war shifted from western Europe and Canada to Canada and the Orient.

Our export trade, however, is only a small part of our import trade and of domestic consumption. In 1920 exports amounted to less than one-sixth of imports. In 1914 exports were approximately only one-hundredth of domestic consumption.

IMPORTS.

Imports of rags appear to fluctuate considerably according to business conditions. Thus during the fiscal years from 1910 to 1913 imports of rags increased steadily from 180,114,457 pounds to 245,113,327 pounds. In the fiscal year 1914, when general industry was relatively depressed, they fell to 180,906,309 pounds. During the war imports remained low, reaching the small amount of 3,914,064 pounds in the calendar year 1918. During the prosperous year of 1920 they reached a record amount, 273,007,172 pounds, but fell to 116,794,391 pounds in 1921.

Imports of other kinds of paper stock [1] have fluctuated far less, their money value during the war being very little less than the average pre-war value. They were greatest in value in the calendar year 1920 when they amounted to $8,792,578, but in 1921 they were only $2,527,185. Quantity figures were not compiled until 1919. In the last three years the quantities have been very nearly equal to the quantities of rags imported.

Rags, before the war, came primarily from the textile countries of western Europe, particularly the United Kingdom, Germany, and France, and also Holland and Belgium. During the war Canada was the principal source, Europe sending practically no rags. One of the most serious complaints of manufacturers of fine paper during the war was the difficulty of securing high-class textile cuttings from Europe. After the war Europe regained its importance as a supplier of rags to the United States, certain countries sending record amounts, although imports from Germany in 1920 were still a small fraction of their pre-war volume.

An appended table (see p. 58) shows also imports of rag pulp. These are considered, however, in the Tariff Information Survey on Wood Pulp and Rag Pulp.

The same general pre-war geographical distribution prevailed also in the case of other kinds of paper stock. The United Kingdom, however, stood out as more important than any other country as a source of "all other" paper stock, and maintained this position steadily throughout the war and after it. Moreover, British India is also an important source. The war affected the distribution of imports much less in the case of "all other" paper stock than in the case of rags, western Europe retaining its importance as a source of supply from 1910 to 1921.

The latest year for which comparable production and import figures for paper stock are available is 1914. In that year our total imports amounted to between one-fifth and one-sixth of domestic consumption, on the basis of value.

[1] Grasses, fibers, waste, etc.

TARIFF HISTORY.

ler the tariff acts from 1883 to 1913 paper stock has been on ›e list.

COMPETITIVE CONDITIONS.

'e is no pressing tariff problem in the case of paper stock e of the fact that there is no industry which has as its function of its functions the production of paper stock. Paper stock is a waste product or a by-product, except in certain minor es such as the production of esparto grass in Spain and , which does not come into competition with any similar y in the United States, and which involves very little capital :. It is true that the gathering of old paper and rags has a fairly extensive undertaking in the United States, but it no process other than a concentration in central places of ıaterial obtained from houses, factories, and other buildings l throughout the country, baling or bagging it, and trans- it to the consumer.

PREFACE.

s one of a series of Tariff Information Surveys prepared by ted States Tariff Commission and transmitted to the Com- n Ways and Means. The series covers all of the articles and lities provided for in the tariff act of October 3, 1913, and ıot specifically provided for. It is arranged in the numerical the paragraphs of that act.

me cases two or more paragraphs have been combined in one ıet. In doing this, industrial relationship of the articles has llowed when possible. In those instances where a paragraph ɜn treated under a preceding paragraph of the tariff act, refer- made to this fact at the point where the paragraph appears in ical order. Where one grade of an article is dutiable and r grade of the same article is on the free list, the article is ɜed under the dutiable paragraph, which appears first in ical order in the tariff act. In certain instances articles of industrial relationship and which occur in separate paragraphs tariff act have been combined under one paragraph for con- ıce of discussion. Reference is made to this fact at the point the commodities would naturally occur in numerical order.

ɜ first pamphlet in the series is an "Introduction and index," ı contains:

An introductory chapter discussing the scope of the series and eneral method of treatment.

An alphabetical index of the articles provided for in the tariff f 1913, showing the paragraph of the act in which the article is ided for, and, if discussed under a different paragraph, the ber of such paragraph.

A list of the pamphlets in the series, showing the paragraphs articles included in each pamphlet.

ıus by use of this "Introduction and index" the exact loca- of the discussion relating to a given article or commodity can be rtained.

---

n the preparation of this report the Tariff Commission had the rices of Constant Southworth, of its staff, and of others.

IBULOUS, AND FILTER PAPER AND THEIR MANUFACTURES.

ACT OF OCTOBER 3, 1913.

Papers commonly known as copying paper, stereotype paper, bibulous paper, pottery paper, letter-copying books, wholly or partly manufactured paper and filtering paper, and articles manufactured from any of the papers or of which such paper is the component material of chief value, not specially provided for, 20 per centum ad valorem.

SUMMARY.

Paper (148,142 tons in 1921) ranks seventh in production among different kinds of paper in the United States, being exceeded by paper boards, newsprint, book paper, wrapping paper, fine paper, and building paper. The production of blotting paper, the principal kind of bibulous paper, in 1919 was about one-fourteenth as much as tissue paper. Litmus paper, classified as bibulous paper, and filter paper are specialties produced in very small quantities. An estimate places the annual production of filter paper in the United States at 500 tons.

There is no tariff problem in the tissue and blotting paper industries. The United States, like the other important paper-producing countries of the world, has an exportable surplus of tissue and blotting paper. On the other hand, the United States exported in 1919, 5 per cent of the domestic production and imported in 1921 only one-third of 1 per cent of production. Imports of blotting paper into the United States are practically negligible now. It is probable that exports will increase. Imports. Litmus paper is unimportant. No import or export figures are available. This country produces only an ordinary grade of filter paper for clarifying liquids and for qualitative work in chemistry. The United States is dependent on England, Sweden, Germany, and France for practically the whole supply of high-grade filter paper for quantitative chemical analysis.

[a] Includes copying, stereotype, bibulous, tissue, and pottery papers.

General Information.

DESCRIPTION.

Tissue paper.—Tissue paper is a thin paper of fine, soft texture, silky to the touch, translucent, and to a limited extent transparent; it is distinguished from other kinds of paper chiefly by its thinness. The better qualities are made from rag and the cheaper from wood pulp. Its principal uses are for toilet purposes, for napkins, and for wrapping articles, especially articles liable to tarnish. The anti-tarnishing quality results from special processes pursued in its manufacture which free it from sulphur or other chemicals that tarnish metal. Wrapping paper, which is also tissue paper, is considered as tissue paper for tariff purposes and bears a duty of 30 per cent instead of the 25 per cent duty on wrapping paper n. s. p. f.

Copying, stereotype, pottery, and crêpe papers, as specified in paragraph 323 of the act of 1913, are special varieties of tissue paper, their output forming, however, only a very small percentage of the total output of tissue paper. Copying paper is a strong, unsized, usually cheap tissue paper used for the manufacture of letter books, in which copies of letters are kept, and also for the manufacture of carbon paper. The letter-copying books themselves are also dutiable under paragraph 323 at the same rate. Stereotype paper is an extra strong pliable tissue used in the manufacture of stereos (molds or matrices) from which printing plates are made. It is often an absorbent, unsized, so-called waterleaf paper. The sheets of paper, a considerable number together, and backed by matrix paper, which is an absorbent paper similar to high-grade hard blotting paper, and by ordinary brown paper, are pressed against the type to form the mold, the metal for the plate being then cast in the mold. Pottery paper, a term not used in the paper trade, is either a thin tissue of good quality, well glazed, used for wrapping pottery, or a special kind of tissue paper by which designs are transferred to pottery. Crêpe paper is a very thin, tough, strong tissue, made usually of com-

colored and passed through heavy embossed rollers, le the paper into a form resembling crêpe. It is used nd decorative purposes; also for paper towels. Kraft r is an unusually strong tissue paper, made wholly or in hate wood pulp.

and filter paper.—Bibulous paper is a porous, absorbent for soaking up liquids. Blotting paper is the principal bibulous paper. One kind of tissue paper, used for mas-ses, is called bibulous tissue paper. Litmus paper, a emically treated paper, used to determine whether a solu-l or alkaline in nature, is, for customs purposes, regarded s paper. Filter paper, although separately named in the eally a kind of bibulous paper; the domestic product in s a very ordinary grade, differing little from blotting paper principally for clarifying liquids. It is used by manufactur-p, varnish, paint, sugar, color, and pharmaceutical prod-by electrical companies to filter oil for transformers. It is for chemical qualitative analysis. The best grades for ive analysis are not made in this country, but must be im-Recently, however, a beginning has been made in manu-the better grades. Toweling paper partakes of the char-s both of absorbent or bibulous paper and of tissue paper. quently a crêpe paper of somewhat greater thickness than tissue paper.

in the tariff classification of 1913.—The terms "bibulous nd "pottery paper" are now very little used in the Ameri-e. They are likely to cause confusion in reporting imports. ariff classification of the act of 1913 in grouping bibulous and per with tissue paper is apparently based more on a desire together all papers bearing a 30 per cent duty than on any ced similarity of material, structure, or use. Thus, in the ation of the several kinds of paper provided for in paragraph bulous paper is between stereotype paper, which is a variety e paper, and tissue paper itself, although bibulous paper in is entirely unlike tissue paper. Filter paper is adjacent to aper without a comma between, as if to imply some particu-ose relationship, whereas in reality the two varieties are un-material, method of manufacture, and use.

such a classification is liable to mislead is demonstrated by icles imported under paragraph 323 of the act of 1913 as d by the Bureau of Foreign and Domestic Commerce. reau in question, because the item, copying paper, is named ecords imports of these papers under the general heading ing and similar papers and manufactures of." This classifica-a grouping of wholly dissimilar varieties of paper, viz, tissue ibulous paper, under a minor subdivision of one of those ies, copying paper being a relatively unimportant kind of paper. Moreover, the figures for the imports of crêpe paper hose for filter paper are reported jointly, although, as noted, varieties have little in common beside the fact that they are paper.

40822—23—M-3——2

Also the inclusion of letter-copying books between varieties of unmanufactured paper is open to objection on the grounds of inconsistency.

DOMESTIC PRODUCTION.

The production of tissue paper ranks seventh in the scale of the domestic output of paper, being exceeded by that of paper boards, newsprint, book paper, wrapping paper, fine paper, and building paper. In value of production, however, tissue paper ranks ahead of building paper. The production of blotting paper is only about one-fourteenth that of tissue paper. The other grades discussed, filter paper and litmus paper, are specialties produced in very small quantities in this country.

Materials.—The material used in the manufacture of tissue paper consists of rag pulp, chemical wood pulp (principally sulphite), and to some extent ground wood. A similar gradation of material exists in the case of blotting paper, except that soda wood pulp is used to a greater degree than sulphite. Filter paper is usually made from high-grade cotton-rag pulp, with sometimes a little wool fiber mixed in. Litmus paper is made mainly of rag pulp and to some extent of chemical wood pulp. Although much wood pulp and considerable quantities of rags are imported, they come in free, the former principally from Canada and to some extent from the Scandinavian countries and the latter from Europe. Thus the availability of the main raw materials is not affected by the tariff.

Secondary materials are rosin, alum, dyes, china clay, agalite, and tincture of litmus. Rosin is used for sizing purposes to decrease the porosity and absorbency of the paper, and, if a design or anything else is to be printed on it, to allow it to take the ink without blotting. Alum is used to precipitate the rosin and any coloring materials which may be used. Filler, which renders the paper opaque and gives it body, is very little used in the varieties of paper under discussion, except blotting paper and composite matrices made of stereotype paper. The principal fillers are talc, agalite (ground asbestine fiber), and china clay. English china clay is considered by many people the most satisfactory kind of china clay. Tincture of litmus is used for impregnating the paper from which litmus paper is made. These secondary materials are used in small amounts. Obtaining them presents no difficulty and no tariff problem. (For special consideration of rags, English china clay, and coloring materials in relation to paper manufacture, see survey on fine paper.)

Equipment.—Practically all the machinery and other equipment of the tissue, blotting, and filter paper industries are manufactured in this country. The American product appears to be as satisfactory as any foreign paper machinery. The American manufacturer of these kinds of paper is in as advantageous a position to procure equipment as the manufacturer in any other country.

Methods of production.—The preparation of the wood and rag pulp prior to the paper-making process is described in the survey on wood pulp and rag pulp. The process in the beater and in the Jordan refining engine is exactly the same for the papers under discussion as for any other kind of paper. (See survey on printing paper.)

ssue paper must be made ordinarily on a special machine because
s extreme thinness. The web of paper has not the strength to
r across unsupported from one part of an ordinary paper machine
nother. Moreover, it does not need as much pressing and drying
ost other varieties of paper. A modification of the Fourdrinier
ıine known as the Harper machine is much used to meet these
.al conditions. This machine resembles an ordinary Fourdrinier
ıine (see survey on printing paper), with the entire portion
d of the presses turned around end for end, for the wire travels
y from the presses instead of toward them. The paper formed
he wire is carried back from the couch rolls (at the end of the
) on a long felt traveling on rolls high above the wire. This
supports the paper until it enters the presses, and sometimes even
l it enters the dryers; thus there are no gaps to bridge, such as
t between the couch rolls and presses in the ordinary Fourdrinier
hine. Because of the little pressing required, the Harper machine
uently has only one set of press rolls.

dryer of the type used on a Yankee machine is often employed
drying tissue paper, on account of the ease and comparative
kness of drying such paper. This dryer consists of a huge single
nder, sometimes considerably more than 10 feet in diameter,
reas on the ordinary Fourdrinier machine there are many drying
nders of 3 to 5 feet diameter. It has a polished surface, against
ch a set of press rolls runs, the top press roll coming in contact
ı the surface of the dryer. A dryer felt carries the paper around
cylinder and between the cylinder and the press rolls. By this
hod a shiny surface, unobtainable by ordinary calendering, is
arted to one side of the paper, the process being somewhat
ilar to ironing laundry. It is not a fast way of producing paper,
vever, for the cylinder, in order to dry the paper in one revolution,
st run slowly. Not all tissue paper is dried in this way; a great
l is dried over ordinary drying cylinders and is machine calendered.
fter the tissue paper is made, a number of finishing processes cut
p into the desired sizes, perforate it (in the case of toilet paper
paper towels), and, if necessary, roll it up.

Blotting paper is made in the ordinary way, usually on a Four-
ıier machine, but sometimes on a cylinder machine. (See sur-
's on printing paper and on paper boards.) The best blotting
ers are made of cotton fiber, because of its great capacity to soak
liquids. Soft soda pulp, preferably poplar, gum, or sycamore,
vever, makes a satisfactory medium grade. Esparto fiber is
ch used in England to produce the same grade. These fibers
da and esparto) are light, short, bulky, and opaque, and much
ter adapted to making blotting paper than is sulphite wood pulp.
e survey on wood pulp and rag pulp.) Cheap blotters are some-
ıes made of almost pure mechanical wood pulp. The Germans
ke an extra-thick blotting paper out of waste cotton with 20 per
ıt wool addition. From 10 to 20 per cent of filler appears to be
owable in blotting-paper manufacture without diminishing the
sorptive power of the paper. Agalite (ground asbestine fiber)
he best filler for the higher grades and china clay or chalk for the
ver grades. The Germans have a process for strengthening the
rder of blotting paper by impregnating it with substances not
ily soluble in water, such as varnishes, fats, rosin, soap, glue,

gelatin, etc., which are frequently treated with tannin, alum, formaldehyde, etc.

The principal requirements of good blotting paper are absorbency, a good printing surface, and freedom from hairiness. Hairiness tends to cause smudging of the ink.

The best filter paper is the purest form of cellulose in general use. Filter paper should be made of a good quality of cotton rags. Sometimes a little wool fiber is mixed in. The rags are boiled with caustic soda and then bleached with gaseous chlorine. No sizing is used. Great skill is needed in adjusting the speed and in determining the correct period of beating, for if the stock is beaten too slowly the rate of filtration in the finished paper will be too slow, while if the stock is beaten too freely fine-grained precipitates will pass through the filter. The nature of the beating will be determined by whether a thorough and hence slow filtering paper or a fast and hence not a very thorough filtering paper is desired. The best filter paper, after being made on the paper machine, is treated with hydrochloric and hydrofluoric acid to remove the inorganic impurities. The Swedish system is then to freeze the paper; this renders it soft and minutely porous, as the action of ice crystals, while forming, forces the fibers apart with just enough vigor to produce pores of the most suitable size and shape.

The English have a good system of toughening ordinary filter paper. They dip it quickly into concentrated nitric acid, drain it rapidly, place it in running water, and then immerse it in 0.5 per cent ammonium hydroxide until all acid is neutralized. They then wash it in running water, drain, and partially dry it between sheets of blotting paper; after it is removed from the blotting paper it is fully dried at a high temperature, and then the whole process is repeated. The linear shrinkage is about 9 per cent.

Only filter paper for accurate quantitative analytical work needs these special treatments. Papers for rough qualitative work and industrial purposes are not so treated.

After being made into sheets filter paper is ordinarily stamped out in disks of various diameters, which are packed together in bundles for sale, although a good deal is sold in sheet form. The heavier grades are sold in large sheets for filter presses and other industrial work.

Considerable quantities of filter-paper stock are never made into paper at all, but are dried and sold in bulk form as filter masse for packing into various forms of stoneware and metallic filtering apparatus. For this purpose sulphite wood pulp is an effective and cheap substitute for cotton rag pulp. (See survey on filter masse.)

Litmus paper is made from an ordinary waterleaf (unsized) paper of rag or wood pulp, similar to the cheaper grades of filter paper. The paper is soaked in tincture of litmus.

Organization.—The grades of paper discussed, like all other kinds of paper, are usually produced in large factories, each one capitalized at a large amount, for expensive machinery occupying considerable space is necessary. The establishment of a paper mill, especially one which makes its own pulp, takes a long time. The investment is thus necessarily a permanent one.

The greater number of the mills producing tissue paper manufacture that kind of paper only. Nearly half the concerns converting

e paper into toilet paper also manufacture the tissue paper itself. t concerns in the United States make blotting paper. Some of e make a small quantity of litmus paper. Seven concerns manure filter paper.

wide domestic market exists for tissue and blotting paper, while us and other special absorbent papers and filter paper, on account heir limited use, are usually manufactured only in response to ial orders.

anufacturers of tissue paper are affiliated in the Tissue Paper ufacturers' Association and converters of toilet paper in the et Paper Converters' Association. No special associations exist manufacturers of the other kinds of paper in question, as far as e particular grades as such are concerned.

Number of mills.—In December, 1920, there were 101 mills in the ted States manufacturing tissue paper; of the companies owning e mills 16 made crêpe paper, 7 copying paper, and 5 stereo tissue er. Of the 52 concerns making toilet paper, 26 made their own ue paper on Fourdrinier or Harper machines, being included ong companies owning the above total of 101 tissue-paper mills; were merely converters, purchasing their tissue paper. In July, 2, 95 mills were manufacturing tissue paper. Of the 54 concerns king toilet paper in 1922, 25 made their own tissue paper.

Filter paper and blotting paper, as already noted, were made in 22 by 7 and 8 companies, respectively. Paper for towels was made 24 companies.

Geographical distribution.—Nearly one-half of the tissue paper oduced in this country is made in New York. New Jersey, Wisnsin, New Hampshire, Pennsylvania, and Massachusetts are the ner important States producing tissue paper. Richmond, Va., is e largest blotting-paper center in the United States. The District Columbia, Connecticut, Massachusetts, and Ohio are also of nificance in blotting-paper manufacture. American filter paper made in Massachusetts, Pennsylvania, Wisconsin, Minnesota, ew York, and Virginia.

Domestic production and consumption.—Between 1899 and 1920 the oduction of tissue paper in the United States increased more than fold, from 28,406 tons in 1899 to 177,447 tons in 1920. In 1921, it creased to 148,142 tons but reached 108,569 tons in the first seven onths of 1922.

An appended table, page 13, of monthly tissue-paper production om 1919 to 1921 shows an increase from an average of slightly ver 10,000 tons per month in the first half of 1919 to nearly 15,000 ns per month in the second half of 1919. The increase continued owly in 1920 to about 17,000 tons per month during the summer. rom October, 1920, to January, 1921, a marked decrease took place wing to the business depression. However, production gradually ncreased during 1921. Production in December, 1921, was more han twice that of January, 1921.

The production of blotting paper more than tripled between 1899 nd 1914, increasing from 4,351 to 14,157 tons in that period. However, it decreased to 13,420 tons in 1919.

As already noted, the domestic production of filter and litmus paper sed in chemistry is very small. One estimate places the annual ilter production at 500 tons.

Domestic production of tissue paper supplies practically the whole of domestic consumption, imports into this country in the calendar year 1920 amounting to one-third of 1 per cent of production. Blotting paper used in the United States is also practically entirely produced at home, although before the war some came from England. Filter paper likewise is produced principally at home, except for the best grades for accurate quantitative work, which must be imported.

Domestic exports.—The only exports separately reported are those labeled "tissue and toilet paper," and these have been compiled only from 1918 up to 1922 by value, not by quantity. In 1918 they amounted to $1,443,578, in 1919 to $2,056,607, and in 1920 to $2,654,529. In 1921, they decreased to $906,411. In the calendar year 1919 the United States exported 5 per cent of the domestic production of tissue paper (including toilet). In the first seven months of 1922 exports amounted to 2,217 tons, or 2 per cent of production. The value of these exports was $656,252.

Canada is the largest market, with $304,616 worth of imports from the United States in the calendar year 1921. The next most important market in 1921 was the United Kingdom, with imports valued at $178,237. Mexico and Cuba were the only other important markets in 1921, although in 1919 and 1920 the United States exported considerable quantities to other Latin-American countries and to countries in the Far East.

The domestic exports of filter paper are insignificant.

FOREIGN PRODUCTION.

Tissue paper.—As in most other grades of paper, the United States leads the world in the production of tissue paper. Nevertheless, some European countries produce tissue paper, particularly tissue paper for carbonizing, which is superior in certain respects to American paper, and is used, to some extent, in the United States. English carbonizing tissue paper is of excellent quality. Before the war, although reliable comparative figures for tissue paper production are not available, Germany was probably second to the United States in importance. Thus, in 1914 Germany exported $795,350 worth of tissue paper, which is probably considerably more than the United States exported in that year. Germany's exports of tissue paper went in largest amount to the United Kingdom. Next most important as the destination of Germany's exports were Austria-Hungary, Switzerland, and other European countries. The United States received $26,765 worth. Sweden can not meet home requirements in tissue paper, and therefore must import it in considerable quantity. Norway produced only 2,320 metric tons of tissue paper in 1909. The United Kingdom before the war was dependent on Germany, Austria, and France, and to some extent the United States, for part of her tissue paper. Canada in 1919 produced only 3,530 short tons of tissue and toilet paper, valued at $806,438. As the United States exported to Canada in that year $430,360 worth of tissue paper, and in 1920, $797,395 worth, it will be seen that Canada imports from this country nearly as much as she produces.

Blotting paper.—Separate figures for foreign production are not available. It is significant, however, that before the war the United States could market high-class blotting paper in Germany and

ı, the countries from which the United States might most ex-
mpetition. Sweden in 1912 imported 83 tons of blotting and
aper, 20 of which came from the United States. However,
ı also exported some blotting paper, though not as much as
ported. The United Kingdom imports considerable quantities
ting paper. The United States, Germany, and Sweden are her
ources of imports. Canada produced practically no blotting
whatsoever in 1917 or in 1919.

r and litmus paper.—The best grades of filter paper are manu-
d in England, Sweden, Germany, and France, where there
umber of firms that have given special attention to the sub-
nd have produced a wide variety of filter papers suitable to the
s requirements of the chemist. Before the war Germany was
incipal manufacturer of filter paper, Sweden was second, and
was third. During the past five years England has built up
stantial business in high-grade filter paper and has forged
front in the scale of production. England now ranks first
weden second; Germany and France rank next with approxi-
y equal production. The United States is dependent on these
ies for its supply of filter paper for quantitative analytical

Litmus paper in foreign countries, principally those just men-
, is a specialty, as it is in the United States, and is produced in
small quantities.

IMPORTS.

ing to the system used in compiling import statistics, it was
ılt up to 1919 to determine the separate amounts of the imports
varieties under discussion. The figures for imports of copying,
type, bibulous, tissue, and pottery papers, however, come
r close to the figures for imports of all grades of tissue paper,
though they omit crêpe paper and include bibulous paper.
increased from 524 tons in the fiscal year 1907 to 998 tons in
scal year 1914, but fell off sharply during the war. In the
dar years 1919, 1920, and 1921 they were 342, 428, and 514
respectively. As shown in the summary table, the 1920 im-
were one-third of 1 per cent of domestic production, and in
scal year 1914, when imports were largest, they were only 0.86
per cent of production.

e imports of the different varieties of tissue paper in the cal-
r years 1919 to 1921 were separately stated, except that the
and filter paper combination was maintained. Imports of
paper as such were much the most important, amounting in
to 456 tons. Copying and crêpe came next, though the latter
t separable from filter paper. Imports of pottery and stereo-
paper were almost negligible.

e imports of bibulous paper, eo nomine, amounted in the calen-
ear 1921 to only 15 tons.

separate figures for imports of blotting paper are available.

ports of crêpe and filter papers increased from 191 tons in the
year 1907 to 438 tons in 1915 (although the latter figure in-
s also manufactures of these grades). Since then they have
eased, amounting to only 290 tons in the calendar year 1921.
ould considerably enhance the usefulness of these figures were
mports of the two grades separated. England, Sweden, France,

Germany are the principal foreign sources of filter paper. This
ne only variety of paper under discussion for an important part
ne supply of which the United States is dependent on imports,
tically our whole supply of high-grade filter paper being im-
ed.

nports of manufactures of copying, stereotype, bibulous, tissue,
ery, crêpe, and filtering papers decreased from $1,839,831 in the
l year 1917 to $43,893 in the calendar year 1921.

PRICES.

an appended table, page 15, are shown domestic prices of the
cipal grades of tissue paper from 1910 to September, 1922, com-
l from the Paper Trade Journal. They remained at a fairly
tant level from 1910 to January, 1916, at which time the range
including antitarnish paper) was 42½ to 50 cents per ream. In
mon with all other kinds of paper, they increased rapidly dur-
he first half of 1916, July prices in that year being in each instance
e than double January prices. In the latter part of 1916 they
eased a little more, but receded somewhat during 1917. During
they rose slowly, only to decrease during the early part of 1919.
ne latter part of 1919 they began to rise again, increasing almost
out a break to a range of $1.95 to $2.25 per ream in September
October, 1920. In November, 1920, they were caught in the
p which struck general commodity prices some months earlier,
they declined materially. There was a gradual decrease during
and the first half of 1922. Toward the end of the summer of
, however, all quoted prices were withdrawn in anticipation of
ncrease.

ne range of prices for blotting paper from January, 1920, to
ary, 1921, as furnished by the District of Columbia Paper
ufacturing Co., is shown in an appended table, page 17. In
ary, 1920, the range of prices for the various grades was 10¾
3 cents per pound. In August prices reached their high level,
h was maintained until October, when the range was 13¾ to 20
s. After that they decreased somewhat, the range in January,
, being 12½ to 18 cents.

ne prices of domestic filter paper now (1922) range from 22 to
ents per pound. These are approximately twice the pre-war
es.

TARIFF HISTORY.

ntil the tariff act of 1890 the grades of paper under discussion
not separately enumerated. That act placed an 8-cent per
d plus 15 per cent ad valorem duty on copying paper, filtering
r, so-called silver paper, tissue paper, and their manufactures.
act of 1894 changed the duty on these papers to 35 per cent ad
rem. The act of 1897 added bibulous, stereotype, pottery, and
e paper to the list and omitted silver paper, drawing a distinc-
between papers weighing not over 6 pounds to the ream and
r weighing from 6 to 10 pounds per ream. Six cents per pound
15 per cent ad valorem duty was levied on the lighter grade
5 cents per pound plus 15 per cent ad valorem on the heavier.
crêpe paper, filter paper, and letter-copying books, however,
the latter duty. The act of 1909 made no change in classifica-
or duty. The 1913 act abolished all weight qualification and

l the varieties in the 1897 and 1909 acts under a 30 per
ılorem duty.
)07 to 1913, under the acts of 1897 and 1909, the equivalent
m duty on tissue paper ranged from 39 to 42 per cent, and
ınd filter paper from 40 to 50 per cent, both being lowered
cent in 1913. There is no evidence that the lowering in
duced any effect on imports, for the increase in imports
3 was no greater than during the preceding years. More-
relation of imports in one year to those in another are
by the inclusion of manufactures in the figures for certain
l not in the figures for other years.

COMPETITIVE CONDITIONS.

omestic industries producing the grades of paper under dis-
are not subject to dangerous foreign competition. Imports
paper and blotting paper into the United States are almost
le and were little more before the war than they are now.
ər, domestic manufacturers have built up an export trade
al times the import trade. The United States exports tissue
n substantial amounts all over the world, including the
Kingdom, a highly competitive European market. Certain
an countries, however, particularly the United Kingdom,
ıy, and France, produce very fine tissue paper. English
)aper for carbonizing is of excellent quality, and is imported to
xtent into the United States.
ır paper, on the other hand, is largely supplied to the United
by foreign countries. Domestic manufacturers do not put
)or and care into its manufacture that some European coun-
lo. The domestic product for rough, qualitative work and
rial purpose is from the tariff standpoint almost a different
odity from the pure imported quantitative grade for chemical
ıis. Hence importations perform here the function of supple-
ng a domestic production inadequate to meet the demand for
mption—or they may even be regarded as supplying a com-
ıy not produced in the United States.

STATISTICAL TABLES.

Domestic production of tissue paper, by States, 1899–1919.

Rates of duty, 1890–1913.

Par.	Tariff classification or description.	Rate of duty.
419	Papers known commercially as copying paper, filtering paper, silver paper, and all tissue paper, white or colored, made up in copying books, reams, or in any other form.	8 cents per pound and 15 per cent ad valorem.
307	Papers known commercially as copying paper, filtering paper, silver paper, and tissue paper, white, printed, or colored, made up in copying books, reams, or in any other form.	35 per cent ad valorem.
397	Papers commonly known as copying paper, stereotype paper, paper known as bibulous paper, tissue paper, pottery paper, and all similar papers, white, colored or printed, weighing not over six pounds to the ream of four hundred and eighty sheets, on a basis of twenty by thirty inches, and whether in reams or any other form.	6 cents per pound and 15 per cent ad valorem.
	If weighing over six pounds and not over ten pounds to the ream, and letter copying books, whether wholly or partly manufactured.	5 cents per pound and 15 per cent ad valorem.
	Crêpe paper and filtering paper	5 cents per pound and 15 per cent ad valorem.
410	Papers commonly known as copying paper, stereotype paper, bibulous paper, tissue paper, pottery paper, and all papers not specially provided for in this section, colored or uncolored, white or printed, weighing not over six pounds to the ream of four hundred and eighty sheets, on the basis of twenty by thirty inches, and whether in reams or any other form.	6 cents per pound and 15 per cent ad valorem.
	If weighing over six pounds and less than ten pounds to the ream, and letter copying books, whether wholly or partly manufactured.	5 cents per pound and 15 per cent ad valorem.
	Crêpe paper and filtering paper	5 cents per pound and 15 per cent ad valorem.
	Provided, That no article composed wholly or in chief value of one or more of the papers specified in this paragraph shall pay a less rate of duty than that imposed upon the component paper of chief value of which such article is made.	
323	Papers commonly known as copying paper, stereotype paper, bibulous paper, tissue paper, pottery paper, letter-copying books, wholly or partly manufactured, crêpe paper and filtering paper, and articles manufactured from any of the foregoing papers or of which such paper is the component material of chief value.	30 per cent ad valorem.

COURT AND TREASURY DECISIONS.

Crêpe paper applies to paper subjected to a crêping process, and a paper made by that process and resembling crêpe paper generally, but somewhat heavier, and treated with sizing for waterproof purposes, is dutiable as crêpe paper. (Fiegel *v.* United States, 167 Fed. 537.)

Hygeia paper used for wrapping straws and toothpicks was held properly classified as cigarette paper under the act of 1897. (Hygeia Antiseptic Toothpick Co. *v.* United States, 1 Ct. Cust. Appls. 497.)

The proviso to paragraph 410 of the act of 1909 was held to cover all articles composed of tissue paper, and by providing that such articles should pay no less rate of duty than that imposed upon the component paper of chief value of which any such article was made, classification of tissue-paper fans was held to be proper under that paragraph. (United States *v.* Mason, 2 Ct. Cust. Appls. 236, of 1911.)

Thin, unsized paper of fine, soft texture, silky to the touch, translucent, and to a limited extent transparent, used for wrapping articles, especially those liable to tarnish, commonly known to the trade as tissue paper, weighing 10¼ to 10½ pounds per ream of 480 sheets, 20 by 30 inches, although much heavier than ordinary tissue paper, was held more specifically provided for as tissue paper in paragraph 323 of the act of 1913 than as wrapping paper in paragraph 328, or as paper not specially provided for in paragraph 332. (Germania Importing Co. *v.* United States, 6 Ct. Cust. Appls. 467, of 1915. Paper for copying paper, not ready for use as imported, has also been held dutiable as tissue paper and not as copying paper (Abstract 37732, of 1915; followed in Abstract 40039, of 1916); so has "tea papers" used in making hygienic napkins (Abstract 29900, T. D. 32842, of 1912). The provision for "tissue paper" is more specific than that for "wrapping paper" in paragraph 324. (G. A. 7631, T. D. 34904, of 1914.) Heavy crinkled paper, used as embossing stock where high relief is to be obtained, is crêpe paper. (Abstract 32597, T. D. 33511, of 1913.) Round-cut bowl paper used in embossing machines and disks cut from filtering paper and ready for use in filtering were held dutiable as filtering papers. (Abstract 32596, T. D. 33511, of 1913; Abstract 24511, T. D. 31182, of 1911.) Litmus paper in sheets is dutiable as bibulous paper under paragraph 323. (T. D. 36274, of 1916.) Books of litmus paper, consisting of strips of litmus paper, about 2½ inches by ⅜ inch, stitched together at one end and having a surface-coated paper cover, were held dutiable under the act of 1913, as manufactures of bibulous paper or of which such paper is the component material of chief value. (T. D. 36519, of 1916.) Imitation Panama hats made of strips of tissue paper rolled and cut so as to imitate grass or straw were held dutiable under the act of 1913, as articles manufactured from tissue paper. (T. D. 36398, of 1916; Abstract 41839, of 1918.)

Other articles held dutiable under paragraph 323 as manufactures of tissue or crêpe paper are hats, caps, and boxes of tissue or crêpe paper (Abstracts 38875, of 1915, and 39248, 39509, and 40312, of 1916), fans of tissue paper (Abstract 39457, of 1916), and so-called crackers or snappers of crêpe, tissue, and ordinary paper (Abstract 40171, of 1916).

ed "day shells" composed in chief value of handmade tissue
ere held to be dutiable as manufactures of paper not spe-
ovided for under paragraph 332 of the act of 1913 rather
ler paragraph 323 as articles of tissue paper, the Board of
Appraisers holding the fact that the tissue paper, the most
component in the articles, was handmade excluded it from
ph 323. (G. A. 8492, T. D. 38952, of 1921; followed in
t 44924, of 1922.)

PARCHMENT AND VELLUM.

ACT OF OCTOBER 3, 1913.

PAR. 568. Parchment and vellum [Free].

GENERAL INFORMATION.

DESCRIPTION AND DOMESTIC PRODUCTION.

Parchment is the skin of sheep, goats, lambs, young calves, and other animals, prepared and polished with pumice stone for writing, painting, engraving, drawing, expensive binding, etc. In the United States it is used to a considerable extent for diplomas. A cheap grade is also used for making drumheads. Vellum was originally made of calfskin only. Now the term is used for fine parchment made from skins of calves, kids, and dead-born lambs. Parchment and vellum were among the earliest writing materials.

The domestic production of parchment and vellum in the United States is very small, being confined apparently to the cheaper grades used for drumheads and for bookbinding. All the finer grades are imported.

IMPORTS.

As shown in an appended table, page 21, imports of parchment and vellum were fairly constant in value at a range of $50,000 to $75,000 per year during the fiscal years 1907 to 1917. In the calendar year 1918 they dropped to $17,425. In the calendar years 1920 and 1921 they amounted to $144,113 and $67,937, respectively.

Before the war England was the source of practically all of the imported parchment and vellum. Germany, France, and Russia in Europe were the only other countries that sent appreciable quantities to the United States. Figures for imports by countries since 1914 are not available. Practically all imports into this country come from England and France.

TARIFF HISTORY.

By the act of 1883 and by every act since that time both parchment and vellum have appeared on the free list.

Court and Treasury Decisions.

rovisions for "parchment and vellum" have been held not to such as are used for manuscripts and similar purposes, but le qualities used for various other purposes such as for binding overing bottle stoppers, and for drumheads and lamp shades. 562, T. D. 39231, of 1922, following G. A. 5303, T. D. 24303,

The board distinguished United States *v.* Lyon (4 Ct. Cust. 84, of 1913), in which it was held that drumheads were as parts of musical instruments under paragraph 467 of the 09 rather than as dressed skins under paragraph 451 of that claim was made in the Lyon case that the merchandise ave been classified as parchment.

able parchment was held to be synonymous with parchment d dutiable accordingly under paragraph 324 of the act of her than exempt from duty under paragraph 568 as "parchd vellum." (G. A. 7736, T. D. 35526; Abstract 38609, of

PARCHMENT PAPER AND IMITATION PARCHMENT PAPER.

ACT OF OCTOBER 3, 1913.

PAR. 324. * * * parchment paper, * * * 25 per centum ad valorem; * * * grease-proof and imitation parchment papers which have been supercalendered and rendered transparent or partially so, by whatever name known, all other grease-proof and imitation parchment papers, not specially provided for in this section, by whatever name known, * * * 35 per centum ad valorem; * * *

SUMMARY.

These varieties of paper are specialties, and are produced in very small quantities compared with such grades as newsprint, wrapping, and writing paper. The annual production of parchment paper (vegetable parchment) in the United States amounts to about 12,000 tons; that of imitation parchment paper is not known. The industry is located almost exclusively in Pennsylvania, New York, Massachusetts, Michigan, Wisconsin, and a few neighboring States. There are six parchment-paper mills. In the calendar year 1920 imports amounted to four-fifths of 1 per cent of the domestic production of parchment paper. On the other hand, between 1917 and 1920 four of the six parchment-paper mills exported from 11 to 17 per cent of total domestic production. The United States imports a negligible amount of imitation parchment paper (66 tons in 1920) compared with domestic production. Europe is the main source.

There is no tariff problem at present in these grades of paper. Imports are so small that they are no menace to the domestic industry. The problem of what foreign competition the future will bring forth is inextricably bound up with the present chaotic conditions of production, finance, and exchange in Europe.

, to June 30, 1914.

General Information.

DESCRIPTION.

ıent paper.—Parchment paper is an unsized or waterleaf ıade preferably of cotton rags, vegetable fiber, or sulphite lp which has been treated with dilute sulphuric acid. It ts name from the fact that in many ways its qualities are o those of parchment, which is the prepared and polished heep or goats. It is dull in finish, dense, hard, and hornlike; ase proof, waterproof, translucent, and to a limited extent ent. Its chief uses are for drawing, bookbinding, as covers s in medicine bottles, for filtering in sugar manufacture, and ng gutta-percha, as a wrapping paper for greasy substances various food products, and as a casing for sausages.

nized paper, another type of parchment paper, is produced ınner similar to the method of producing parchment paper but is treated with zinc chloride instead of with sulphuric This paper is much used, a number of sheets being pressed r in the manufacture of trunks, tubs, wastebaskets, trucks, Villesden paper is a variety of parchment paper made by paper through an ammoniacal solution of copper oxide.

table parchment is synonymous with parchment paper.

term "parchment paper" is applied also to a high-class all-rag ; paper, much like a bond paper. Such paper, however, is ıported as parchment paper and is not considered in this . (See Court and Treasury decisions, page 34.)

ation parchment paper.—Grease-proof or imitation parchment le of sulphite wood pulp, preferably that produced by the ıerlich or slow-cook process. In the course of manufacture ock is subjected to an unusually extended process of beating, reduces it to a gelatinous condition. The first finished product process is a paper with a dull finish, dense and hard, resembling ment paper in various ways, especially in the characteristic ke appearance above noted. The paper is not waterproof and partially grease proof—that is, it is not entirely impervious to , but nevertheless it has the quality of resisting grease to a d extent. The paper is more tenacious than sulphite paper

not so treated; it is translucent and imperfectly transparent. A part of the paper thus produced is afterwards moistened and run through supercalender rollers under heat and pressure; it loses thus its dull finish and becomes very glossy and more perfectly transparent.

The dull, uncalendered kind is known variously in the trade as imitation parchment, grease proof, and pergamyn. The calendered, transparent kind is usually called glassine, parchmyn, or japanin paper, although sometimes, as in the tariff act of 1913, it is also called grease proof. Both kinds are used as a wrapping for cakes and similar articles which do not require a perfectly grease-proof covering. The supercalendered variety is more useful, however, for the manufacture of an outer wrapping for bottles and boxes, through which labels may be read, as the transparent material for "window envelopes," and for making sanitary protectors for telephone receivers.

DOMESTIC PRODUCTION.

The parchment paper and imitation parchment industries are not extensive compared with other branches of the paper industry. Their products are specialties, produced in relatively small amounts.

MATERIALS.

The chief materials of the parchment-paper industry are cotton rags and sulphite wood pulp. Formerly unsized rag stock was used almost exclusively, but has now been largely supplanted by bleached sulphite stock. Such additions as mechanical wood pulp should be avoided, for they are liable to char or burn and thereby to cause the finished product to be full of tiny holes. Sulphuric acid and ammonia are the ordinary chemicals used. Zinc chloride and sometimes nitric and sulphuric acids and dextrin are used in making vulcanized paper. Copper oxide is used in making Willesden paper. Almost all these materials are produced in the United States in such amounts that the relatively small quantities needed in this industry are easy to obtain. Part of the sulphite pulp supply is imported from Canada and from Sweden, free of duty. (See survey on wood pulp.) Rags are also imported to some extent, free of duty. Soda ash, lime, bleach, and acid-proof coloring matters are used in making the untreated waterleaf paper.

Sulphite wood pulp is almost the sole constituent of imitation parchment paper. Both for parchment and for imitation parchment papers it is desirable to use the Mitscherlich variety of sulphite pulp. This is a superior grade, cooked longer and more slowly than the ordinary variety.

There appears thus to be no tariff problem in obtaining the raw materials of parchment and imitation parchment papers.

METHODS OF PRODUCTION.

Parchment paper.—Paper for parchmentizing is made in the beater and in the refining engine and on the Fourdrinier machine in almost the same way as any other kind of paper. (See survey on printing paper.) The sole difference is in the fact that sizing, loading, and coloring materials are not used. The only material going into the beater is the pulp—either rag or sulphite.

vaterleaf (unsized) paper has come off the Fourdrinier passed as a continuous sheet through a bath of acid of rength at a speed which insures the correct period of As the treated paper leaves the bath it passes through ls which remove the excess of acid. The paper is then a series of tanks containing fresh water, the last traces neutralized by small amounts of ammonia or some other in the last washing tank. The wet parchment is passed ers and dried over steam-heated cylinders. It must be ly stretched as it dries, because it shrinks enormously, otherwise become cockled and uneven.

eets of parchment paper are frequently made by passing s of paper through the acid bath and bringing them tween the rollers before washing. The sheets unite when ether; the remainder of the process is the same as that or single sheets.

chmentizing process increases the strength of the paper ur times and the density about 30 per cent.

ed fiber is made by passing a continuous sheet of paper bath of strong zinc chloride, which causes the cellulose to nd partially gelatinize. As a large excess of strong zinc s necessary, the process is rendered commercially possible he careful recovery of the zinc from the washing waters, submitted to chemical treatment. The vulcanized product ently treated with nitric acid or with a mixture of nitric uric acids to make it waterproof. Dextrin is often used to e chemical action that necessary manipulation of the mate- re washing it may be possible. A number of sheets are pressed together while the paper is in a colloidal (jellylike) , prior to washing. Finally, the excess of zinc and acid completely removed.

den paper is made by passing paper through an ammoniacal of copper oxide, as a result of which the paper is impregnated per oxide and a superficial gelatinization of the surface takes The copper oxide helps to preserve the paper and renders it oof.

sulphocyanate process of making parchment paper has just veloped. Instead of sulphuric acid or chloride of zinc, solu- metallic sulphocyanates are used, the process of immersion he same as the one already described. The same sort of paper . One sulphocyanate or a combination of sulphocyanates of t metals may be used. The sulphocyanates of calcium, mag-, strontium, and lithium when used alone produce satisfactory . Mercuric sulphocyanate may be used to good advantage in ation with one of the sulphocyanates just mentioned, partic- calcium sulphocyanate. The addition of calcium chloride or other nonactive salt helps in dissolving the sulphocyanate. imes acetic acid is added to acidify the solution.

canized paper is produced also by this process; it receives onal treatment after the parchment paper itself is made.

itation parchment paper.—The essentials of the process of making tion parchment paper have already been described. Instead of made by applying special chemical processes to ordinary un- paper, as in the case of real parchment paper, imitation parch-

ment paper receives its peculiar characteristics direct from the beating process. Sulphite pulp is placed in the beater and allowed to circulate much longer than is required for the ordinary varieties of paper. The knives of the beater roll are kept dull, so that there is a rubbing and crushing, and not a cutting effect on the fibers. Because of this prolonged beating, the fibers undergo a process of hydration or water absorption that imparts a gelatinous consistency to them. This hydrated fiber is run off on the Fourdrinier paper machine in the usual way. If the beating process is carried to its fullest extent, the fibers are so completely hydrated that their individual structure is entirely broken down and they become cellulose jelly, which agglomerates and hardens on drying to the consistency of bone.

As already noted, a part of the imitation parchment paper is afterwards moistened and run through supercalender rolls under heat and pressure, thus becoming transparent.

Organization.

In January, 1921, there were six mills carrying on the parchmentizing process in the United States with a capacity of 110 tons per day. At that time, they were operated at only 45 per cent of capacity. According to the manufacturers, only four mills produce the untreated waterleaf paper for parchmentizing. In January, 1921, these were operating at 62 per cent of their daily capacity of 90 tons. A number of concerns in addition to the six referred to reported in 1920 that they were producing parchment paper. It appears probable, however, that what they called parchment paper was in reality a variety of high-grade writing paper, and not parchment paper in the sense of an acid-treated waterleaf paper. Paper of this sort is discussed in the survey on fine paper and envelopes.

The capital invested in four out of the six parchment paper mills from 1916 to 1919 was as follows:

1916	$3,209,000
1917	3,638,000
1918	4,826,000
1919	5,038,000

Imitation parchment paper is produced by nine concerns. Eight of these nine produce glassine, the calendered variety; greaseproof, the uncalendered kind, is produced by seven firms; six of the nine, of course, produce both kinds. Imitation parchment is the staple product of seven out of the nine concerns.[1]

The imitation parchment paper manufacturers are organized in the Glassine and Greaseproof Paper Manufacturers' Association.

Geographical Distribution.

Parchment paper is produced in Kalamazoo, Mich.; West Carrollton, Ohio; Passaic, N. J.; Glen Mills, Pa.; and West Conshohocken, Pa. Glassine, or calendered imitation parchment paper, is produced in Pennsylvania, New York, Massachusetts, New Jersey, Indiana, Wisconsin, and Oregon. Greaseproof paper is produced in the same States as glassine, except that none is made in New Jersey.

[1] Lockwood's Directory of Paper and Allied Trades.

HISTORY OF THE INDUSTRY.

ment paper.—According to manufacturers, since 1885, 27 ent paper plants have been established, only 6 of which have d; this is attributed in part to fear of German competition.

DOMESTIC OUTPUT.

domestic output of vegetable parchment is, on the average, 2,000 tons per year. This production supplies practically the lemand for consumption, imports in 1920 amounting only to 1 per cent of domestic production. The following table shows duction of parchment paper (vegetable parchment) from 1915).[2]

	Pounds.
015	27,053,733
016	29,008,485
017	24,407,430
018	25,078,683
019	23,464,960
920	21,668,445

figures are available for the production of imitation parchment Its production is reported monthly to the Federal Trade ission, but the figures are not segregated, being included in ;ures for wrapping paper.

COST OF PRODUCTION.

nparative statistics of production costs here and abroad are not ible. However, according to figures compiled by the vegetable ment manufacturers from income-tax reports, the average do- c cost of production of 1,000 pounds of parchment paper ased from $74.62 in 1915 to $200.88 in 1920, and the cost of ead and selling from $5.32 to $20.15. The total cost of putting the market thus increased between 1915 and 1920 from $79.95 20.90 per 1,000 pounds. In the same period the average selling increased from $83.33 to $225. According to these figures the profit, in percentages of the price received, was 4 per cent in , 15 per cent in 1916, 15.8 per cent in 1917, 12.3 per cent in 1918, per cent in 1919, and 2 per cent in 1920.

DOMESTIC EXPORTS.

rchment paper.—In 1917 four out of the six parchment paper s exported 17 per cent of the total parchment paper output of United States. From 1918 to 1920 the proportion of total pro- tion exported by the four mills averaged slightly over 11 per cent. amounts of these exportations are shown below:

	Short tons.
1917	2,070
1918	1,349
1919	1,392
1920	1,209

igures furnished by manufacturers in brief filed with the Committee on Ways and Means.

The manufacturers state that exports of parchment paper have been made in recent years to the British Isles, France, Belgium, Egypt, India, South Africa, Australia, New Zealand, Japan, and China, all of which markets, except France and Belgium, were supplied almost exclusively by Germany before the war.

FOREIGN PRODUCTION.

Separate figures are not available. The following table, however, shows the number of mills in the different countries manufacturing parchment and imitation parchment paper in 1920, as reported to the Papermakers' Directory of all nations:

Germany	38	Holland	3
France	29	Australia	2
United States	19	Canada	2
United Kingdom	18	Russia	2
Norway	9	Spain	2
Belgium	6	Denmark	1
Sweden	6	Poland	1
Italy	5	Switzerland	1
Finland	5	Portugal	1
Czechoslovakia	3		

The parchment paper manufacturers of the United States state that their potential foreign competitors in the order of greatest tonnage are Germany, Austria, Belgium, and France. Belgium manufactures a very fine grade of parchment paper, which is probably superior to anything made in the United States.

IMPORTS.

Parchment paper.—Imports of parchment paper in the calendar year 1920 amounted to only 0.77 of 1 per cent of domestic production. Appended tables, page 32, show imports for consumption of parchment and imitation parchment papers from 1907 to 1921. Under the acts of 1897 and 1913 the two varieties were separated, but under the act of 1909 they were reported jointly. Imports of parchment paper from 1902 to 1909 averaged between 100 and 150 tons per year. From then until 1920 it is impossible to determine the quantity imported, though the amounts were less during the war than previous to 1910. In 1920 imports of parchment paper amounted to 84 short tons, valued at $61,806; in 1921 they were 63 tons, valued at $39,439.

Statistics of imports of parchment paper were compiled by countries up to 1906, after which they were discontinued. Belgium was the most important source, sending approximately half the imports to the United States. Germany, Austria-Hungary, France, and the United Kingdom ranked next. Imports during these years averaged a little under 150 tons per annum.

Imitation parchment paper.—Imports of imitation parchment have fluctuated greatly, as have also the relative proportions of imports of the calendered and uncalendered varieties.

In the fiscal year 1911 more than 4,000 tons of imitation parchment paper (including what was probably a very small proportion of real parchment paper) were imported. In the calendar years 1918 and

y 17 and 78 tons, respectively, were imported. In the year 1920, 66 tons were imported. In 1921 imports increased ons. Under the act of 1909 from the fiscal year 1910 to year 1913 the supercalendered grade (glassine) represented o-thirds of the imports. Suddenly, in the fiscal year 1914 ortion changed, very small amounts of glassine having been since the act of 1913 went into effect. Imports of grease- per also greatly decreased after 1915, but not as much as f glassine. In 1921 imports of grease-proof paper amounted ns and those of glassine to 8 tons.

PRICES.

ient paper.—The following table, compiled by the manufac- ows the great decline in the price of parchment paper from the five-year period preceding the war, and its steady rise 5:

[Per 100 pounds.]

Year.	High.	Low.	Average.
			$27.00
			12.00
			8.60
			7.80
	$8.80	$8.00	8.33
	11.50	9.00	11.60
	16.80	14.00	15.30
	18.75	14.90	16.85
	19.45	15.65	17.55
	26.07	18.97	22.50

9 the average price (exclusive of duty) paid for imported at paper was $17.50 per 100 pounds or twice the average price; in 1920 the imported grade averaged $37 per 100 exclusive of duty) or nearly twice the domestic price. Im- uld thus appear unimportant, before the war or at the present a factor in price-cutting in the United States.

TARIFF HISTORY.

he tariff act of 1894 neither parchment paper nor imitation at paper was separately enumerated in the tariff. In 1894 cent ad valorem duty was imposed on parchment paper. of 1897 imposed a specific duty of 2 cents per pound plus a ent ad valorem duty on parchment paper; the 1909 act d this rate. Under the act of 1897 the ad valorem equiva- was considerably lower than the ad valorem duty under f 1894, averaging about 21 per cent for the fiscal years 1907 Under the act of 1909 the equivalent ad valorem rate can gregated.

t of 1909 first separately enumerated imitation parchment rouping it with parchment paper and imposing the same nts per pound plus 10 per cent ad valorem) on both varieties. ated the supercalendered grades of both parchment and parchment paper grouped together from those not super- d. This worked out as a great increase over the 25 per

cent rate of 1897. Although parchment paper and imitation parchment paper are not separated in the import statistics, the former was undoubtedly such a small percentage of the total that the computed ad valorem equivalent rate on the two combined means practically the equivalent ad valorem rate on the imitation grade alone. In any case, the low equivalent rate (about 21 per cent) on parchment paper up to 1909 means that its inclusion with imitation parchment would tend to pull down the equivalent rate on the two combined, as far as it had any effect. The equivalent ad valorem rate, then, on imitation parchment paper, both supercalendered and not supercalendered, under the tariff act of 1909, averaged nearly 50 per cent.

The 1913 act decreased this rate to 35 per cent ad valorem. It imposed a 25 per cent ad valorem duty on parchment paper. Judging from the equivalent ad valorem rate of 2 cents per pound plus 10 per cent ad valorem duty in 1909 (21 per cent) when parchment paper was last separately reported, this 25 per cent rate was an increase.

It will be noted that in 1897 the rates of the two varieties crossed each other. Up to 1894 they were the same; by the act of 1894 the duty on parchment paper was greater than that on imitation parchment paper. By the act of 1897 and the acts since then the duty on imitation parchment paper has been the larger one.

Relation of tariff to imports.—Parchment paper has had a very uniform rate of duty. Its imports, small in amount, have not been visibly affected one way or the other by changes in rates. In imitation parchment the only change since 1907 in the rate of imports at the time of a change in tariff has been that following the tariff act of 1913, when imports of nonsupercalendered imitation parchment suddenly more than doubled in amount over the previous two years. However, the 1911 imports had been as large as the 1914 imports. Moreover, simultaneously imports of the supercalendered variety dropped to almost nothing, although the war did not break out until nearly a year later. Hence the conclusion is that the tariff has had very little to do with the amount of imports of imitation parchment paper.

COMPETITIVE CONDITIONS.

The competitive situation in parchment paper and imitation parchment paper is similar to that existing in fine paper and in wrapping paper. Before the war the United States imported significant but not large amounts of imitation parchment paper from Europe. But imports have since decreased to practically nothing. Imports of parchment paper into the United States have always been almost negligible. Whether in the future the United States need fear competition is problematical. Present conditions of production and exchange are so unsettled abroad that no one can do more than guess as to what Europe will do in international paper trade. Labor costs in Europe have reached what is probably a permanently higher status compared with their former relation to United States labor costs. Belgium, formerly the most important outside source of parchment paper, has done excellent work in reorganizing her industries since the war. Certain grades of Belgian parchment paper are of better quality than anything made in the United States, and it is likely that to some extent, Belgium will expand her market in the United States.

ıent paper.—The fact that in 1920 imports of parchment ıounted to only four-fifths of 1 per cent of domestic pro- and that out of six companies producing four companies ɔorted 11 per cent of total American production, points to g international competitive position of the American parch- ɔer industry. Although the Germans have made consider- ress in manufacturing parchment paper, they have not been uild up an export trade to the United States, even though under the acts of 1897 and 1909 was lower than under the 13. Before 1907, when imports by countries were separately ermany was of much less importance than Belgium as a imported parchment paper. During the five years from 1906, 46 per cent of the imports into the United States m Belgium and only 21 per cent from Germany.

he fact that in 1909 the price paid for imported parchment xclusive of duty) was twice the average domestic price by the manufacturers, and in 1920 was nearly twice the price, indicates that imports have little effect in depressing prices.

ary.—Hence the question of competition in parchment and ı parchment papers can be summed up by noting that (1) ıpetition was not so great as to be dangerous; (2) present ion is practically zero; (3) future competition depends on which are constantly shifting; (4) as far as the effect of ctors can be foreseen, it will be a number of years at least ipments to the United States will approximate pre-war levels.

COURT AND TREASURY DECISIONS.

Parchment paper is made from vegetable fiber, not from wood pulp, is unsized, and is treated with diluted sulphuric acid. It is dull in finish, dense, hard, and hornlike. It is grease proof, waterproof, translucent, and much more tenacious than the original material. Paper invoiced as "white glacé wrapping paper" was held within the provision for "imitation parchment papers which have been supercalendered and rendered transparent or partially so, by whatever name known," and not as wrapping paper under paragraph 415 of the act of 1909. (Germania Importing Co. *v.* United States, 4 Ct. Cust. Appls., 29, of 1913.)

Parchment paper having a cotton cloth back such as is used in the manufacture of worsted yarns, covering the rolls between which the yarn is made to pass in the process of spinning, and known as parchment cloth, was held to be dutiable as a manufacture in chief value of parchment paper rather than as paper. (Stursberg *v.* United States, 3 Ct. Cust. Appls., 370, of 1912.)

Vegetable parchment is synonymous with parchment paper and dutiable accordingly under paragraph 324 rather than free of duty as parchment or vellum under paragraph 568. (G. A. 7736, T. D. 35526, of 1915.)

PREFACE.

ıis is one of a series of Tariff Information Surveys prepared by United States Tariff Commission and transmitted to the Com-ɜe on Ways and Means. The series covers all of the articles and nodities provided for in the tariff act of October 3, 1913, and ːs not specifically provided for. It is arranged in the numerical ː of paragraphs of that act.

some cases two or more paragraphs have been combined in one phlet. In doing this industrial relationship of the articles has followed when possible. In those instances where a paragraph ɔeen treated under a preceding paragraph of the tariff act refer- is made to the fact at the point where the paragraph appears in erical order. Where one grade of an article is dutiable and her grade of the same article is on the free list, the article is ıssed under the dutiable paragraph, which appears first in erical order in the tariff act. In certain instances articles of ı industrial relationship and which occur in separate paragraphs ıe tariff act have been combined under one paragraph for con-ence of discussion. Reference is made to this fact at the point ːe the commodities would naturally occur in numerical order.

ıe first pamphlet in the series is an "Introduction and index," ːh contains:

An introductory chapter discussing the scope of the series and ɜeneral method of treatment.

An alphabetical index of the articles provided for in the tariff ɔf 1913, showing the paragraph of the act in which the article is ided for, and, if discussed under a different paragraph, the ber of such paragraph.

A list of the pamphlets in the series, showing the paragraphs articles included in each pamphlet.

ıus, by the use of this "Introduction and index" the exact loca- of the discussion relating to a given article or commodity can be rtained.

ı the preparation of this report the Tariff Commission had the ices of Constant Southworth, of its staff, and of others.

PRINTING PAPER.

ARAGRAPHS IN TARIFF ACT OF 1913 AND AMENDMENTS.

2.—Printing paper (other than paper commercially known as handmade ndmade paper, japan paper, and imitation japan paper by whatever unsized, sized, or glued, suitable for the printing of books and newst for covers or bindings, not specially provided for in this section, valcents per pound, 12 per cent ad valorem: *Provided, however*, That if ependency, province, or other subdivision of government shall impose uty, export license fee, or other charge of any kind whatsoever ıe form of additional charge or license fee or otherwise) upon printing lp, or wood for use in the manufacture of wood pulp, there shall be imnting paper, valued above 2½ cents per pound, when imported either lirectly from such country, dependency, province, or other subdiıment, an additional duty equal to the amount of the highest export export charge imposed by such country, dependency, province, or on of government, upon either printing paper, or upon an amount r wood for use in the manufacture of wood pulp necessary to manufacing paper.

7.—Printing paper (other than paper commercially known as handne handmade paper, japan paper, and imitation japan paper by whatvn), unsized, sized, or glued, suitable for the printing of books and newst for covers or bindings, not specially provided for in this section, ıbove 2½ cents per pound * * *. [Free.]

—On September 8, 1916, the maximum nondutiable value was raised on April 23, 1920, to 8 cents. On April 23, 1922, it returned to 5 cents.

SUMMARY.

two kinds of printing paper—newsprint and book paper. s a cheap grade containing on the average from 75 to ground wood; the remainder is sulphite pulp. It is used newspapers and for various minor purposes. Book perior grade, made principally of sulphite and soda pulp, en containing rag pulp. It is used mainly for printing magazines. There are various intermediate grades rsprint and book paper; the line of division between the s is, hence, not distinct. The act of 1916 distinguishes m on the basis of value. It divides printing paper into -that valued at not above 5 cents per pound and that valcents per pound.[1] The former, newsprint, enters free; ook paper, at a 12 per cent ad valorem duty.

paper, including both newsprint and book paper, is the United States in larger quantities than any other er. In 1921 the output was 1,226,189 short tons of ıd 725,992 short tons of book paper.

paper industry, being confronted with negligible foreign has no tariff problem. In the calendar year 1921, ook paper amounted to less than one-tenth of 1 per cent production. In the fiscal year 1914, when imports were ıest, they amounted to only one-third of 1 per cent of oduction. On the other hand, a substantial export

[1] cents until it was raised on Sept. 8, 1916, to 5 cents and again on Apr. 23, 1920, to 8, 1922, it returned to 5 cents.

paper was built up during the war. In the calendar
s were 8.38 per cent of domestic production in com-
3 per cent in the fical year 1914. In the calendar
1921 the corresponding percentages were 4.33 and
7.

ıt of book paper was imported free in 1914; the equivalent ad valorem rate on dutiable 2.61 in 1914.

General Information.

DESCRIPTION.

Printing paper is a thin sheet consisting primarily of matted and ressed cellulose fibers obtained from wood, cotton, and other vege- ible growths. There are two kinds, newsprint and book paper.

Newsprint.—Newsprint paper, as the name implies, is used mainly r printing newspapers. Minor uses are for cheap magazines, books, talogues, telephone directories, railway guides, school tablets, hand- lls, etc. Some so-called newsprint is used as a cheap grade of wrap- ng paper. Newsprint is cheaper, tears more easily, and is less dura- le than book paper. Standard newsprint, which comprises about 90 er cent of all newsprint, contains usually from 75 to 80 per cent of round wood pulp and from 20 to 25 per cent of sulphite pulp, which a chemically prepared pulp of a grade superior to and more expensive an ground wood pulp. Between standard newsprint and book aper there are various grades of newsprint containing a greater ercentage of sulphite pulp, such as halftone news, special news, ovel news, catalogue news, etc.

Book paper.—Book paper is primarily paper for printing books and her publications. Ordinary book paper is usually made entirely of emical wood pulp. Sulphite is the principal grade used. Rag pulp also much used for the better grades. A great many periodicals and agazines, including women's publications, religious, trade, and rm papers, are published on book paper, as are also books and music. ost catalogues issued by manufacturers and many of those issued by ail-order houses and others are printed either wholly or in part on ook paper. In addition there are a large number of incidental uses paper suitable for printing books. School pads, cheap writing apers, and envelopes are often made of this grade of paper. Large uantities are used for wrapping soap because this kind of paper, roperly prepared, is not affected by the alkali in the soap. It is used r wrapping purposes by druggists, chemical, and patent medicine anufacturers; and also when coated and colored, for lining and cov- ing fancy paper boxes. When used for these purposes, however, it usually known by some other name, such as letter paper, wrapping aper, or coated paper.

The principal grades of book paper are machine finish, sized and upercalendered, coated, and cover. The difference in the first three rades lies mainly in the finish given the paper.

Machine-finish book paper goes through practically the same rocess of manufacture as newsprint. It receives its only finish om passing through calender rolls as it comes off the paper machine. ome variation in finish, however, is possible. Some of the different nishes classed as machine finish are laid, wove, English finish, gh bulk, eggshell, etc. "Laid" denotes certain markings on the eet, consisting of prominent vertical watermark lines wide apart nd smaller horizontal lines close together. "Wove" is ordinary achine finish with fine equidistant markings. "English finish" enotes a dull surface, and in the United States covers a number of nishes, all of high quality. "High bulk" signifies a thick blotter- ke paper, greatly compressed. "Eggshell" is a rough finish in

f an eggshell surface. These different finishes are made
different designs while the paper is still moist. Machine-
is used largely by publishers of books, catalogues, etc.
d supercalendered paper is machine-finish paper which
rough an additional process of sizing and calendering to
rd, smooth finish. A large part of this kind of paper is
olishers of illustrated magazines.
aper is machine-finish paper coated with a paste made of
, starch, and other materials, and then calendered to
igh finish. It is usually coated on both sides, but some-
e side only. It is used for high-grade illustration and
work.[2]
per is a strong, heavy grade which is usually coated. It
ly for the covers of magazines, catalogues, etc. Coated
over paper are separately provided for in the act of 1913.

DOMESTIC PRODUCTION.

RANK OF INDUSTRY.

to the census reports in 1914, the paper and wood-pulp
nked twentieth among the industries of the United States
ue of products. In 1920 out of a total paper production
tons, 2,616,432 tons, or 36 per cent, consisted of printing
print amounting to 21 per cent and book paper to 15
total paper production. In December, 1920, 86 mills
g newsprint and 95 mills book paper. In 1921, a year
depression, total paper production amounted to 5,356,317
ch 23 per cent was newsprint and 14 per cent book paper.
er, 1921, the number of mills making newsprint and
were 86 and 84, respectively.
paper boards the output of newsprint paper was the
ly class of paper. Printing paper as a whole, including
int and book paper, exceeded even paper boards in out-
llowing table shows the production in tons of the different

mation Survey, Surface-coated Paper.

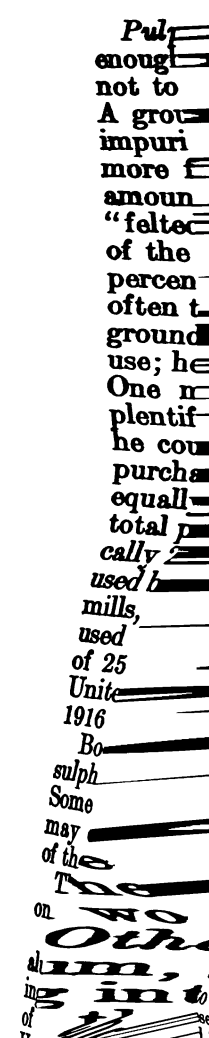
MATERIALS.

wood, esparto, etc.—Pulpwood is the main raw material going pulp for paper. Since 1916 domestic consumption has ted to more than 5,000,000 cords per year for all kinds of Spruce, hemlock, balsam fir, and poplar are the important oods. In 1920 the consumption was divided as follows: Spruce, cent; hemlock 14½ per cent; balsam fir, 5¾ per cent; and poplar ent. About one-fifth of the pulpwood consumed in the United in 1920 was imported from Canada, the remainder being ed at home. Canada is the only foreign source of pulpwood upon. The domestic supply at present is not adequate. It nated that at the present rate of cutting the supply of spruce, k, and balsam fir in the eastern part of the United States, 95 per cent of the pulp and paper mills are located, can not re than 25 years, and that the spruce, hemlock, and fir of the country, including Alaska, will be exhausted in about 70 years. ce is the pulpwood most used, because of its comparative n from resin and other impurities and because of the whiteness pulp it yields. The ground-wood and sulphite pulp produced pruce can be used unbleached in making newsprint paper. ck and balsam fir rank next to spruce in desirability for use ing ground wood and sulphite. They have to a smaller degree ne qualities as spruce. Practically all newsprint is made from lp of these three woods, as well as a large part of the book produced. Certain hardwoods, however, notably poplar condarily beech, birch, maple, and chestnut, are much used in ing soda pulp, out of which a fluffy thick book paper is made, milar to that made of esparto pulp in England.

on rags, and to a smaller extent linen rags, are also used in pulp for a high quality of book paper, but never for newsprint Cotton linters have recently come to be utilized in making kinds of book paper. Esparto grass, imported mainly from and Northern Africa, is much used in Great Britain for making fluffy, high-quality book paper. The use of esparto in the States is negligible. Newsprint is ordinarily, however, made vely of wood pulp with sometimes the addition of a little paper.

ddition to these fibrous growths commercially used for the of printing paper, there are a large number of vegetable nces from which satisfactory newsprint or book paper can be Their use in paper manufacture, however, is not economical, e they ordinarily represent seasonal crops of a bulky nature, ng thus large storage facilities to enable the pulp mill to throughout the year. Furthermore they contain either a rcentage of pith, or, as in the case of straw, a high percentage ous material, which consumes an excessive amount of cooking al and gives low yields of pulp. Such fibers are cornstalks, ane bagasse, the various straws, bamboo, seaweed, banana etc. From bamboo and flax straw an excellent grade of aper is obtainable. Perhaps in future years it will be possible ze these fibers on a commercial scale.

question of our waning supplies of pulpwood and of remedies shortage, as well as the 1920 shortage in high-grade rags, e possible use of other fibers in paper making are discussed survey on wood pulp and rag pulp.



ewsprint paper contains ground wood pulp plus just
hite pulp to make the finished sheet sufficiently strong
k over the paper machine or over the printing presses.
ood fiber is short and stiff, containing resin and other
A sulphite fiber is pure cellulose and much longer and
le than the ground-wood fiber. Introducing a certain
sulphite into the ground wood enables the fibers to be
gether, or interlocked, much more securely. Because
ly varying quality of ground wood produced, a varying
of sulphite is used in newsprint manufacture. It is
nat ground wood bought on the market is not so carefully
so closely screened as pulp made by a concern for its own
nore sulphite is required when ground wood is purchased.
acturer some years ago found that when water was
d he could grind his own pulp and screen it thoroughly
ake a good paper with 13 per cent sulphite, while with
round wood he had to use 30 per cent sulphite to get an
d paper. In 1910 the average proportion of sulphite to
sed in the United States in making newsprint was practi-
cent. In the first half of 1916 the percentage of sulphite
nills ranged from 12.8 per cent to 34.5 per cent for different
an average of 22.4 per cent. The percentage of sulphite
anadian mills ranged from 23.3 to 28.3 with an average
average percentage of sulphite to total pulp used for
es and Canadian companies combined in the first half of
3.3.

per in the main is made of chemical wood pulp, both
l soda. In Great Britain esparto pulp also is important.
use considerable quantities of waste paper. Book paper
n varying percentages of rag pulp, or even, in the case
grades, be made entirely of rag pulp.
tion of supply of wood pulp is discussed in the survey
lp.

erials.—Filler (in the form of china clay, talc, or agalite),
; (usually rosin), and color are the other materials enter-
actual composition of the paper. In 1910 the proportion
condary materials used by 38 newsprint mills in the
es amounted to only 5.5 per cent of all materials used;
ler consisted of wood pulp. Filler is very little used for
aper. A much greater proportion of subsidiary materials
greater variety in the proportions of all materials used,
book-paper manufacture. In 1916 three eastern book-
anies used 40.1 per cent soda pulp; 34.9 per cent sulphite;
t waste paper; 19.4 per cent clay, agalite, and talc; 1.7
m; and 1 per cent rosin. In the same year five Michigan
used 58.9 per cent waste paper, including a small pro-
ags; 5.7 per cent soda pulp; 21.7 per cent sulphite; 8.2
ay, agalite, and talc: 4 per cent alum; and 1.5 per cent
he case of the eastern companies one-fifth by weight of
nanufactured consisted of filler, while in the case of the
mpanies this proportion was less than one-tenth.
ases no difficulty or tariff problem is involved in securing
rials. Certain manufacturers prefer English china clay

nestic clay; according to their judgment it is so far superior to omestic clay as to be practically a different product. During ar there were periodic shortages of this commodity, but it is now obtainable from England. The domestic color industry has developed to a point where it is practically independent of the an, although before the war almost all colors came from any. The yellowish color of newspapers after the beginning e war was due to the lack of German red and blue dyes which ve the characteristic natural wood color of the unbleached pulp, g it appear white.

EQUIPMENT.

st of the equipment used in the United States by manufacturers nting paper is made in this country. Very little pulp and paper nery is imported, but considerable quantities are exported to la and Japan and to a less extent elsewhere. In 1920 exports p and paper machinery were valued at $2,987,657.

United States has reached practically a standstill in installing ewsprint machinery. The development of the Canadian news- industry has meant the purchase by Canadians of large up-to- nachinery from the United States and also, in a measure, from nd. Canada has recently begun manufacturing her own paper nes. In the main the Canadian equipment is newer and more nt.

table below compares the newsprint machines in Canada with in the United States, as they were in 1920. The machines are d into five classes according to their width. Machines up to ches wide may be called small; 101 to 140 inches, medium- 141 to 170 inches, medium-large; 171 to 200 inches, large; and 200, extra-large. The larger machines of both countries are yed almost exclusively on newsprint, while the smaller ones in a many cases are often employed part of the time on other kinds per, such as book, sulphite bond, or wrapping paper. The wide nes operate usually at a very rapid speed. They are hence un- to the making of other types of paper of whose texture more is ded than that it shall have the minimum strength necessary to nt the paper from breaking in the paper machine or in the ng presses. This minimum strength is all that newsprint es. The table was compiled from Lockwood's Directory of the and Allied Trades. In cases where only the width of the trimmed sheet made on the machine was available, a trimming nce was made and added to the trimmed width so as to reduce dths in the table to machine widths.

METHODS OF PRODUCTION.

and paper industry is thoroughly standardized. Prac-
anufacturers in the United States and Canada use nearly
pe and style of equipment, which is almost entirely auto-
ring only a few tenders and their assistants to operate it.
y 10.16 per cent of the wage earners were women, and
1 per cent were under 16 years of age.

er.—Paper manufacture begins with the beater. The
of the wood and rags into pulp is dealt with in the
ood pulp and rag pulp.

er is a large oblong tub with rounded ends, divided into
partition which stops short of the ends and thus leaves a
channel. On one side of this partition, located about two-
e way from one end of the beater, is a large roll extend-
ise across the channel. This is shod with iron bars or
blong cross section running parallel to its axis and pro-
ut an inch from the surface all around the roll. A so-
late similarly imbedded with bars extends across and is
the bottom of the tub just under the axis of the roll. The
lled with pulp and water. Sometimes waste paper is
e roll is made to revolve, causing the pulp to circulate
und the beater and between the bars or blades of the
bars or blades of the bedplate. The fibers are drawn out,
roughly separated, and to a certain extent cut up. The
ne fiber may be regulated somewhat by adjusting the
en the bars of the roll and those of the bedplate, and also
the sharpness of the blades. This process, called beating,
ere from an hour to several hours, according to the kind
be made and according to the judgment of the man in
ne proper manipulation of the stock in the beater is one
ntials of manufacturing good paper and requires great
perience.

pulp has circulated for a time and is nearing the desired
, the other materials are added. Clay, agalite (ground
per), or talc is used as a filler to give the paper body and
and to secure a smooth, polished surface. Filler is

ery little used in making newsprint, however. Liquid rosin used for sizing to eliminate the absorptiveness of the paper and to nable it to receive printing ink satisfactorily. Red and blue aniline yes are added to dispel the natural yellowish wood color of the pulp, aking the paper appear white. Alum has the function of precipiating the rosin and the coloring matter on the fibers.

In an integrated paper mill—that is, one which has attached to it ground-wood mill and a sulphite plant—the pulp is "slushed" r mixed with water and pumped through large pipes to mixing vats r chests, from which it is pumped to the beaters when needed. In ills which buy either or both kinds of pulp, receiving it in "laps" folded blankets of pulp), a "shredder" is used. This is a device for nredding the sheets of pulp into fine flakes before it is introduced nto the beater.

In modern newsprint mills beaters are dispensed with as mixing gents. The slushed pulp, ground wood, and sulphite are pumped in ne desired proportions into huge cylindrical mixing tanks. A mixing ank is ordinarily 14 feet deep and 14 feet in diameter. It holds 2½ ons of pulp at a time. Paddles revolve in it with great force, mixing ne stock much in the fashion of an egg beater. Containers with alum, zing, bleaching materials, and other ingredients are connected with ach tub. The necessary quantities are measured automatically.

Refining.—From the beater or the mixing tank the stock is conveyed to reservoirs or "stuff chests," from which it is pumped up to be assed through a Jordan engine. The Jordan engine gives the last efining touch to the pulp and shortens the beating process. It onsists of a hollow cone in which revolves a smaller cone. The pulp irculates between the cones from the smaller to the larger end, ropelled by centrifugal force. The contiguous surfaces of each cone re equipped with long, narrow steel bars or blades, each resembling omewhat the runner of a skate, although only about one-fourth inch quare in cross section. Between these sets of blades each little undle of fibers not already broken up by the beating process is eparated and the whole stock made homogeneous. From the large nd of the Jordan the pulp passes to a second stuff chest, much milar to the one that receives the stuff from the beaters, and is ept in suspension in water by whirling propellers or "agitators" ntil the paper machine is ready to use it.

The Fourdrinier machine.—The prepared pulp is now conveyed, uch diluted with water, to the paper machine, where it is run as a neet onto a moving screen belt, consisting of fine woven copper ires. Part of the water drains off through the screen and part is emoved by suction boxes over which the wire moves. An endless ubber strap called a deckle, at each side of the wire screen, preents the water and pulp from running off the side of the machine. he distance between the two deckle straps, and thus the width of ne sheet of paper, is adjustable. At the end of the screen the sheet asses between two rolls, which remove more water, runs onto a noving woolen belt, passes through a series of press rolls, which also queeze out water, is dried by being run over a long series of large nternally heated hollow cast-iron cylinders, is passed between calnder rolls to polish the surface, and is then wound up on a roll.

Finishing processes.—The process just described ordinarily completes the manufacture of newsprint paper and machine-finished book

upercalendered and coated grades of book paper receive
eatment. If a particularly high finish is desired, the
through the supercalendering machines. These consist
alternating pressed paper or cotton rolls and hollow iron
one over the other. The sheet is moistened with water
zing solution containing gelatine and alum before it is
ugh the calendering machine. The paper thus produced
ed and supercalendered.
aper, used for printing illustrations and thus requiring an
mooth surface, is paper coated with a solution usually
f clay mixed with casein to cause it to adhere to the paper.
; is applied by passing the paper over one roller revolving
vered in a trough of coating liquid, or between two rollers,
s it is desired to coat one or two sides. Brushes distribute
material evenly. The paper is then dried and run through
machines to produce the desired finish.

ORGANIZATION.

ient conduct of the pulp and paper industry requires
extensive capitalization, and highly developed organiza-
1916 the American newsprint-paper industry operated
s and the book-paper industry only 70 mills. In January,
ills were making newsprint and 93 mills book paper.
paper establishments require an investment of approxi-
,000 per thousand board feet of daily consumption, in
with $1,500 per thousand feet of daily product required
nanufacture.
out 45 United States companies making newsprint paper
companies, with an annual output of more than 25,000
er each, produced more than 82 per cent and 4 companies
t 55 per cent of total domestic production. These four
in order of size were the International Paper Co., with
per mills,[3] 9 of them making newsprint exclusively, the
hern Paper Co., the Crown Willamette Paper Co., and the
& Ontario Power Co. In the book-paper industry, out of
0 companies in the United States, 15 companies, each with
acity of 50 tons or over, were rated to produce 75 per cent
output in 1916. Three companies had a rated combined
f one-third the total domestic output. These were the
nia Pulp & Paper Co., with 15 mills, S. D. Warren & Co.,
er, Burbank & Co. Twenty-three book-paper manufac-
uding most of the large ones, belonged in 1917 to a statis-
ı, which has since ceased to exist. A considerable number
k-paper manufacturers now belong to the Book Paper
rers' Association. The greater number of the American
ian newsprint producers are affiliated in the Newsprint
reau.

GEOGRAPHICAL DISTRIBUTION.

er and pulp industry is concentrated chiefly in the North-
d Lake States, where it was originally established on

ional Paper Co. in 1921 operated 23 pulp and paper mills.

he proximity to pulpwood forests. In spite of the
ıstion of the forests and the constantly increasing hauls
, it has remained geographically almost stationary.
s has the lumber industry been able to keep near its
of raw material, largely because of the fact that the
lack of mobility of a pulp or paper plant commits it to
which it is first established.

wsprint-paper production was distributed as follows:
5 per cent; Maine, 32 per cent; Wisconsin, 9 per cent;
per cent; and all other States, 15 per cent. In 1914
roduction, not including a small amount of paper for
ıph, map, woodcut, etc., was divided as follows: Penn-
per cent; Massachusetts, 14 per cent; Maine, 12 per
n, 11 per cent; New York, 10 per cent; Wisconsin, 9
, 8 per cent; all other States, 21 per cent. The output
istributed in much the same way.

HISTORY OF THE INDUSTRY.

of making true paper was discovered by the Chinese.
ough, this earliest paper was made from what was vir-
ulp and by a method which though simple and crude
essentials the modern process. The papyrus of the
ough giving us the name, was not a true paper.
ufacture first began in the United States about 1690,
as established near Philadelphia. The modern paper
ever, was not used for more than a century. It was
99 by Louis Robert, of Essonnes, France. Up to 1860
er manufacturers made use principally of rags for the
nd vegetable fibers for the coarser grades.

half of the nineteenth century it became manifest that
rags, straw, and other vegetable fibers was inadequate
rowing demand for paper. The pressure for a larger
material brought forth almost simultaneously and
dependently two discoveries of the process of grinding
lp, one in Nova Scotia and one in Germany. Nova
1838 for her discovery and Germany 1840. However,
il 1866 that the first ground-wood machine was installed
States. In the meantime soda-pulp manufacture had
ced from England in 1854. Although the sulphite
ıvented by an American in 1866, the first sulphite pulp
ıited States was built in 1887.

ıtroduction of the ground-wood process paper making
a rapid rate. The estimated daily capacity of Ameri-
t mills reached 400 tons in 1880 and in 1916 had in-
out 4,700 tons. In the decade prior to 1900, however,
pansion of capacity led to overproduction and a con-
ne in prices. In 1898 the International Paper Co. was
t absorbed most of the mills east of the Mississippi
he control of from two-thirds to three-quarters of the
put. Although this combination appeared to have a
ect in strengthening prices, new independent mills were
erproduction continued. Expansion of the American
ustry practically ceased after 1910, the increase in the

mand being taken care of thenceforth by the growing
›wsprint industry. The development of the latter from
1909 to its present status of supplying approximately
American newsprint consumption, in addition to total
›nsumption, has been little short of phenomenal. The
this development are considered in the section on Con-
›reign and Domestic Competition.
0 very little addition has been made to the newsprint-
ipment of the United States. The low prices obtaining
for newsprint caused manufacturers in several mills to
ines to the production of other kinds of paper.
er output also has failed to increase since 1914, with the
f 1920 production, which, owing to abnormally large
owed a considerable increase. According to a compila-
n 1920, 13 new book-paper machines were to be installed
ed States in that year and 7 in 1921. These additions
234,900 tons to the annual capacity of book-paper mills,
per cent of 1920 book-paper production.
he war 45 manufacturers controlling 60 per cent of
utput were made subject to both civil and criminal pro-
the United States courts on the charge of controlling
obtaining a monoply price. The defendants entered
›lo contendere. They were enjoined from further action
of trade, were fined, and agreed for the period of the war
›onths thereafter to hold to a price schedule fixed by the
de Commission. The combination was formed in Decem-
nd was dissolved in November, 1917.

AMOUNT OF PRODUCTION.

›n of newsprint paper increased from 569,212 tons in 1899
1 tons in 1909, but for 10 years thereafter was practically
In 1920, owing to the unprecedented demand, produc-
›ed to 1,511,968 tons. According to the Bureau of the
1914 output averaged 2 cents per pound in value and the
t 3.7 cents per pound. Production of book paper increased
08 tons in 1899 to 694,905 tons in 1909 and to 934,979
1. After 1914, however, annual production fell off slightly
when, in response to unusual demand, it rose to 1,104,464
921 it decreased to 725,992 tons. The average value per
914 was 4 cents and in 1919, 7.2 cents. About five-sixths
›-paper output is plain book paper, which consists of the
›ish and the sized and supercalendered grades.
›wing table shows the various kinds of book paper, with
nts and values, produced in 1914 and 1919.

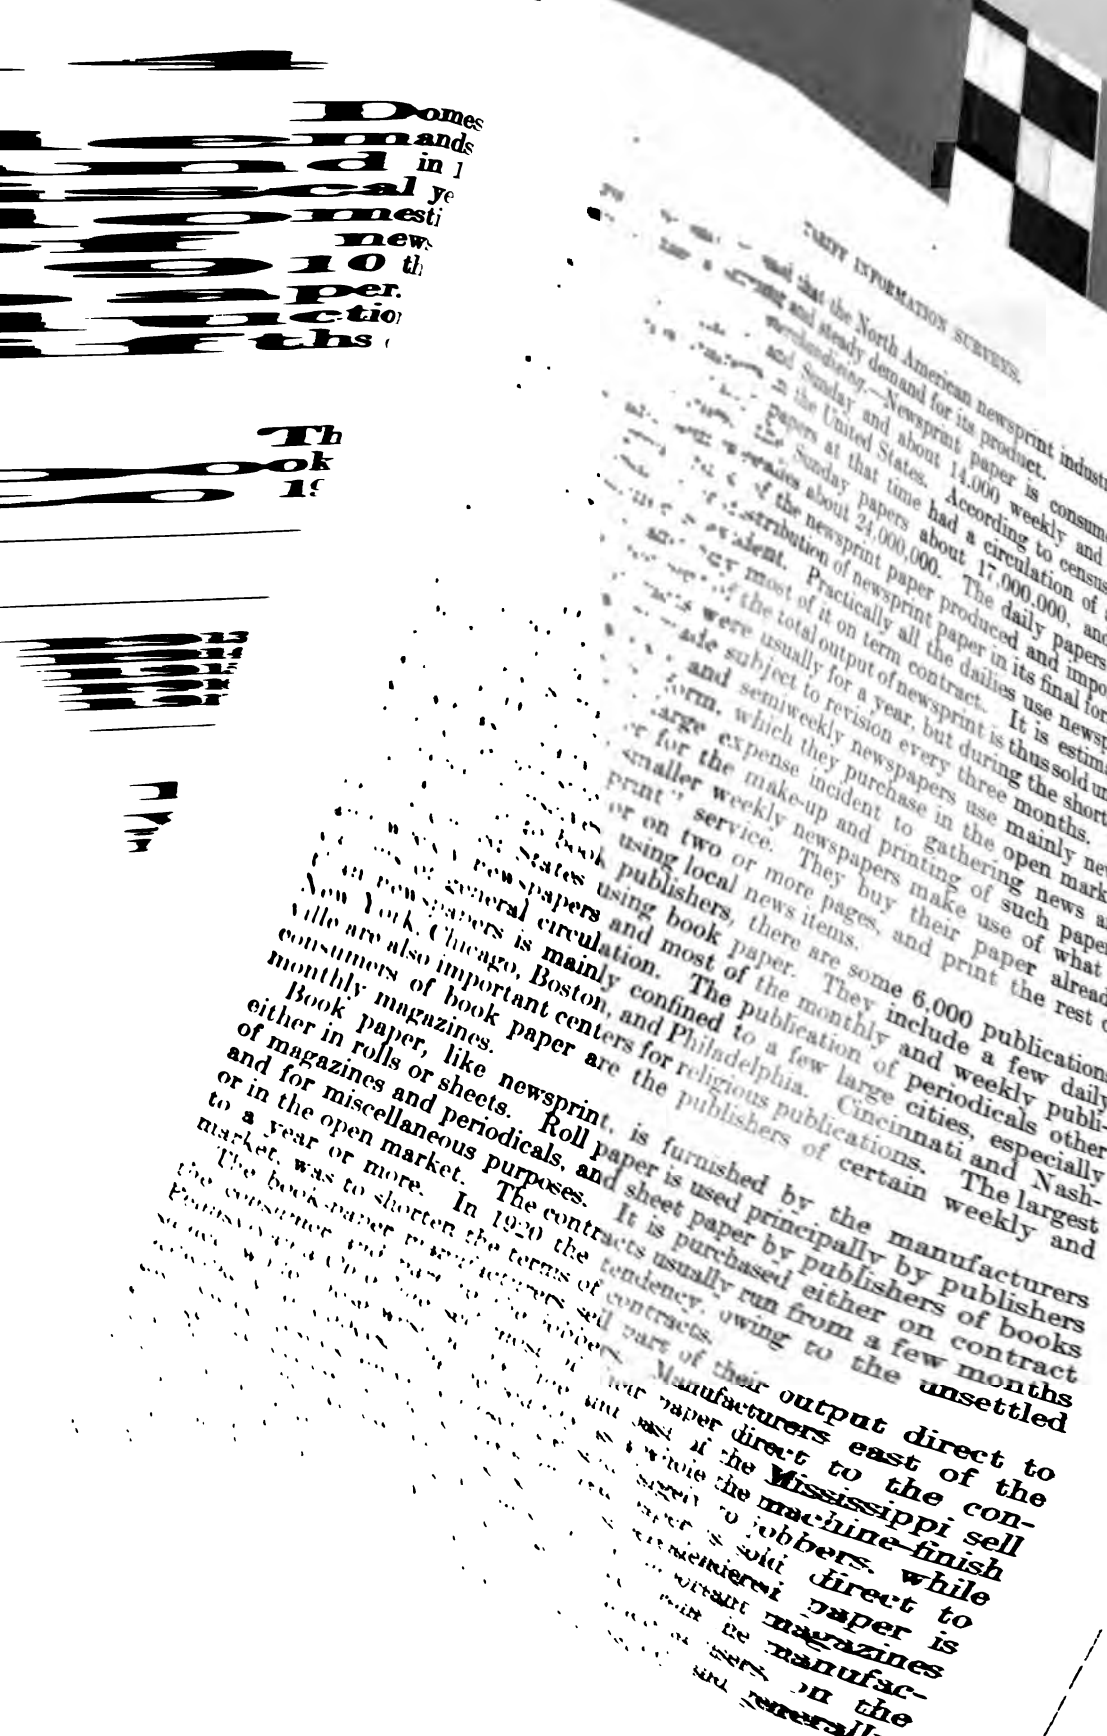
ng in the 23 cities in question was 38 per cent greater in ı 1918, and about 14 per cent greater in 1920 than in 1919. as 9 per cent less than in 1920. In the first eight months vas 4 per cent more than in the corresponding period of

of consumption to production in North America.—The e of consumption at a large figure has necessarily involved ding maintenance of production, except to the extent s from Europe, which began late in 1920, have supplied ın demand. Imports from Europe, however, represent small proportion of total consumption. Canadian pro- ıt be regarded, for all practical purposes, as part of United estic production. Combined American and Canadian roduction was 2,395,183 tons in 1920 and 2,038,095 tons ıus production in 1921 was 85 per cent of 1920 production. n of all kinds of paper combined in the United States in ly 73 per cent of 1920 production. The strong position paper, by comparison, is apparent. Canada, by reason cost of production, was able to maintain in 1921 a better of 1920 production than was the United States. In the es, the production of newsprint in 1921 was 81 per cent production; in Canada it was 92 per cent. It is practi- true that any decrease reacts more unfavorably on the oducers in an industry than on the low-cost producers. ove these questions of sectional distribution of supply it



THE PAPER SHORTAGE OF 1919-20.

he years 1919 and 1920 occurred a remarkable "paper famine." ıortage was most severely felt for newsprint, but it affected also)aper and other grades of paper. Prices rose to unprecedented the great metropolitan papers increased their prices per copy ıeir rates for advertising space; advertisers were urged to ıse and lessen the extent of their advertising display; some country newspapers were threatened with extinction. The)n was such as to lead to congressional inquiry. Hearings eld by a subcommittee of the Committee on Manufactures of ıited States Senate and numerous bills and resolutions were .ced in both houses of Congress.

newsprint shortage was not caused by a decrease of supply. ıave seen, production in 1919 and 1920 amounted to 1,374,517 11,968 tons, respectively, in comparison with 1,260,285 tons . American newsprint consumption in 1919 and 1920 was 10 and 2,195,861 tons, respectively, compared with 1,760,063 1918. And yet the contention that no shortage existed is ıs. A shortage, unless there is a complete absence of supply, ve, not absolute. The existence of a shortage in any com- simply means that those who have been in the habit of using nmodity find it more difficult than previoulsy to secure their supplies. This may be due to decrease in supply, increase nd, or both. In the present case we have seen that the ıctually increased; hence the shortage under consideration,)m the question of the inability of the industry to effect a ıd more rapid increase of output than it did, was due solely ıse in demand.

:rease in demand likewise may be due to either or both of ors. These are the increase in the requirements of those e been using the commodity and an increase in the number of that commodity. In the case at issue the former factor e operative, for the total number of daily newspapers in the tates decreased from 2,514 in 1917 to 2,374 in 1921, and the triweekly, and semiweekly papers from 16,824 in 1917 to 1921.

ıcrease in the newsprint requirements of the individual :r was due primarily to the strenuous advertising campaign :0. The main causes of this were the general revival of following the war and the effects which business men had luced by such advertising campaigns as were conducted e war by the Red Cross and the Liberty loans. The excess- x is said to have stimulated advertising, but the effect of s at least a debatable subject.

mand for advertising space in the newspapers became so npetitive that newspapers instead of soliciting were obliged heir patrons. Rates were raised, maxima of advertising week for any one advertiser were established, newsprint by the year were made subject by the paper manufacturers l every three months at revised rates, and other conditions sed on advertising and on purchase of newsprint.

tors that prevented a greater increase in domestic news- luction are considered below in connection with American)n with Canada and other countries.

Although it received less publicity than the newsprint shortage and was not so acute, there was also a shortage of book paper in 1919 20, due in part to increased advertising in periodicals and catalogues and in part to the great increase in book publishing which took place during and immediately following the war. The expansion in book publishing was occasioned apparently by three factors. The first of these was the large number of books written on the war. The second was the demand immediately after the war for schoolbooks. During the war schools postponed buying new books on the probability that after the war books would be cheaper. After the armistice publishers were drawn on for all available schoolbooks and published large editions—often up to 100,000 copies. The third factor was the effect of the war in stimulating a general interest in reading of an informative nature. People had more money to buy books and, because of shorter working hours, more time to read. The increase, however, was not so much in variety as in large editions.

DOMESTIC EXPORTS.

Newsprint.—In 1911 and 1912 domestic exports of newsprint were practically equal to imports, but have not increased so fast as imports since that time. In 1921 domestic exports amounted only to about one-fiftieth of imports. Newsprint exports a little more than doubled between 1911 and 1919, but decreased in 1920 and 1921 to less than those of 1911. In 1911 they amounted to 49,755 tons, in 1919 to 110,268 tons, in 1920 to 45,889 tons, and in 1921 to 16,812 tons. Only a very small proportion of the newsprint output of the United States has been exported. In 1913 exports amounted to 3.85 per cent and by 1919 had increased to 8.02 per cent, but declined to 3.04 and 1.37 per cent, respectively, in 1920 and 1921. Argentina and Cuba, in 1920 and 1921, were the largest importers of American newsprint. Other countries receiving substantial shipments in past years are Australia, France, the United Kingdom, Cuba, Mexico, Canada, Brazil, and Chile. Small shipments are made to most of the other countries of the world.

Book paper.—Domestic exports of book paper increased from 13,654 tons in the fiscal year 1911 to 76,691 tons in the calendar year 1919, but declined to 47,558 tons in the calendar year 1920 and 20,092 tons in 1921. They represent only a small proportion of production. In 1914 they amounted to 1.53 per cent of production and by 1919 had increased to 8.38 per cent. In 1920 they were 4.33 per cent of production and in 1921 only 2.77 per cent. Australia, Argentina, Japan, China, Brazil, Chile, Canada, Cuba, Mexico, and the United Kingdom are the principal recipients. As in the case of newsprint, small shipments of American book paper are sent to most parts of every continent.

FOREIGN PRODUCTION.[1]

The world.—An appended table (page 42) of the world's production of printing paper made of wood pulp in the year 1913, compiled by an Austrian authority, is of value as showing the pre-war proportions of production of the different countries. The total output was 3,643,000 tons. Of this amount the United States produced 1,394,000

[1] This section was prepared in collaboration with Paper Division of the Bureau of Foreign and Domestic Commerce.

actically half. Germany came next with 557,000 tons, or sixth; the United Kingdom was third with 312,000 tons, more than one-tenth. France, Austria-Hungary, Russia, d Sweden followed next in order. The other Scandinavian roduced very small amounts.

it was estimated that the world's newsprint producing id consumption per annum by principal producing coun- pproximately as follows:[4a]

Country.	Capacity.	Consumption.
	Short tons.	*Short tons.*
.....	530,000	300,000
.....	300,000	450,000
.....	150,000	210,000
.....	185,000	30,000
.....	150,000	10,000
.....	110,000	10,000
ountries.....	200,000	110,000
e.....	1,625,000	1,120,000
.....	1,500,000	2,000,000
.....	1,000,000	130,000
.....	150,000	(1)
.....	40,000	(1)
.....	4,315,000	(1)

Germany, and the Scandinavian countries are the only ntries with an export trade in newsprint of sufficient to compete in American and foreign markets with ewsprint. The United Kingdom and France are forced considerable portion of the newsprint they use. Russia imes is an importer of newsprint in spite of her vast in most other lines of industry, she is backward in nanufacture. Japan is not an important competitor 's markets.

By all odds the most striking development in the er field has been the increase during the last decade newsprint production. For reasons referred to here- e American newsprint industry in about 1909 failed to neet the growing domestic demand of the newspapers. r hand, the Canadian newsprint industry has emerged ty since 1909 to the position of a large-scale producer in tput in that year being equal to two-thirds of the Ameri-

It is almost certain that within a few years Canada argest producer of newsprint in the world. The follow- ows Canadian newsprint production from 1909 to 1921:

ar.	Short tons.	Year.	Short tons.
.....	150,000	1917.....	689,847
.....	350,447	1918.....	734,783
.....	414,982	1919.....	794,567

ternational Newsprint Conference at Stockholm, April, 1921, from Newsprint Service eports to the Bureau of Foreign and Domestic Commerce.
nditions of Foreign and Domestic Competition, p. 29ff.

In 1917 the value of the Canadian output was $38,869,084, in 1918 $46,230,814, and in 1919 $54,427,879.

The newsprint tariff issues between Canada and the United States may be more readily understood if one regards the American and Canadian newsprint-paper industries as essentially one and the same entity, having the same principal markets and the same interests, when not modified by protective-tariff duties or by export embargoes on the finished product or on essential raw materials. Geographically they form in the main one group of mills, being much more closely allied than different portions of some other industries lying entirely inside the United States. To a certain extent they use raw material from the same source. A large part of the Canadian and the American newsprint mills are members of one association. Something like half the capital invested in the Canadian newsprint-paper industry is of American origin. As a result of these conditions Canada's development may be considered almost in the light of a northward extension of the domestic industry, taking place largely for the purpose of supplying American newspapers with newsprint. Yet the fact that Canada is a separate political unit has played a considerable part in accelerating the northward movement of the industry through the Canadian provincial pulpwood embargoes, which make Canadian Crownland pulpwood unavailable to mills in the United States.[6] These embargoes and other factors influence the comparative production costs of the two countries.[7]

From 1917 until 1920 the Canadian Government forced newsprint manufacturers to retain 15 per cent of their production for home consumption. On April 6, 1920, however, the Supreme Court of Canada ruled that this restriction was illegal. After that date Canadian producers were unhampered in the disposal of their products.

The following table shows the 1917 and 1919 production of the different kinds of book paper in Canada:

Material used.	1917		1919	
	Quantity.	Value.	Quantity.	Value.
	Short tons.		*Short tons.*

(1) Not separately shown.

Canada's production was equal to about 4 per cent of the American output in both years.

Germany.—Recent figures for newsprint production in Germany are not available. In 1921, however, it was reported that the German output of newsprint was increasing, while consumption was decreasing; as a result there was an exportable surplus. According to a German trade journal, the number of mills making newsprint in

ı newsprint industry, in its domestic trade and in its
ı received no Government subsidy. The only Government
given the newsprint manufacturers in the last few years

has taken the form of aid rendered in the matter of securing to them full allotments of freight cars and of coal.

However, the newspaper publishing industry of Germany began in July, 1922, to receive direct Government subsidy. Owing to the unsatisfactory politico-financial situation, many newspapers had become unable to pay for the newsprint they needed. Consequently, on July 21, 1922, the Reichstag enacted remedial legislation, the most important part of which was a provision for a tax of 0.15 of 1 per cent on the value of German exports of all kinds of commodities, the proceeds of which are to be turned into a so-called "Reimbursement fund for the German press." This fund will be used to reimburse the press for the amounts paid for newsprint paper in proportion to the quantity consumed. In ascertaining the amount consumed, paper used for advertising will not be taken into account. A sliding scale is to be used by which the reimbursement per unit of newsprint purchased by any one newspaper varies inversely with the amount purchased. Thus large editions are discouraged. Pending executive regulations fixing the date on which this export tax was to go into effect, the Government was empowered to make the granting of an export license conditional upon the payment of a special contribution to the reimbursement fund amounting to 0.15 per cent of the value of the goods exported.

Certain other provisions of the act of July 21, 1922, took effect on the day the law was passed. A tax of 0.5 per cent was levied on the price of timber sold by persons having the use and profit of forest land of more than 10 hectares in size. The proceeds of this tax go into the reimbursement fund, to be used for the benefit of the press. The law of July 21, 1922, also authorized the Federal Government to establish maximum prices for timber, chemical wood pulp, and printing paper on the basis of production cost figures to be compiled by the Government, and to unite the manufacturers of wood pulp and printing paper and establish a uniform scale of prices.

Scandinavian countries.—Although Sweden, Norway, and Finland are not large producers of newsprint, compared with the United States, Canada, and Germany, they are of considerable importance in meeting the deficiencies in production of such countries as the United Kingdom, France, and (in normal times) Russia. Indeed, the position occupied by these Scandinavian countries in relation to the other western European countries is quite similar to Canada's position in relation to the United States. Owing to development of the newspaper publishing industries and the increasing inability of the forests to supply the necessary pulpwood in the United Kingdom, France, and other western European countries, the northern regions, more plentifully forested, were drawn on for supplemental supplies. The newsprint production of these countries could be considerably increased by converting a larger proportion of their wood pulp into paper, but as the pulp they export is now made into paper by the importing countries, this change would mean merely a shift in the place of conversion, not an increase in the world's supply of newsprint paper or even a larger volume of exports of forest products from Scandinavian countries.

In the export of coarse paper, such as newsprint paper, Sweden, Norway, and Finland have in the last three years (1919–1921) become

[5] Computed from a given total value of $1,568,000 and an estimated unit value of 2 cents per pound; figure is only approximate.

Finland and Germany in the volume of their export trade in newsprint in 1921 surpassed Sweden and Norway. As noted above, Germany's exports of newsprint more than doubled between 1920 and 1921. Finland's export trade increased somewhat; Sweden's decreased slightly. Norway's 1921 exports were much smaller than her 1920 exports. The situation in Germany has been so abnormal, by reason of collapsed exchange; that it is hardly to be compared with the Swedish and Norwegian situations. In the case of Finland, however, the continuity of production and the absence of strikes, lockouts, and other kinds of industrial warfare during the last two or three years stand in such contrast to conditions in the Swedish and Norwegian industries that they can not be explained solely on the ground of advantages accruing from depreciated exchange. Finland probably has a permanent advantage over Norway, Sweden, and Germany as an exporter of newsprint paper.

IMPORTS.

Newsprint.—Imports of newsprint paper increased from 54,022 tons in the fiscal year 1911 to 792,481 tons in the calendar year 1921. The increase has been unbroken. The ratio of imports to total domestic production of newsprint increased from 11 per cent in 1913 to 65 per cent in 1921. Up to 1920 from 98 per cent to more than 99 per cent of newsprint imports came from Canada, or from Canada, Newfoundland, and Labrador. Small amounts came from Norway and Sweden. No newsprint was imported from the latter two countries in the calendar year 1919; in 1920, however, they resumed shipments to the United States in amounts exceeding pre-war volume. Finland also began shipments in appreciable amounts. In the latter part of 1920 shipments of considerable size from Germany were made, amounting to 21,066 tons for the four months from September to December. Shipments from Norway, Sweden, Finland, and Germany continued during 1921 and the first 8 months of 1922. The imports increased in 1921 to such an extent that for that year imports from Canada, though retaining nearly the same aggregate tonnage, decreased considerably in proportion. In 1921 the percentage of

ıda was 82.8; from Sweden, 6.2; from Germany, 4.9; from Norway, 2.5; and from all other countries, 0.7. nports of book paper are of negligible importance. 000 tons were imported annually before the war, an ıbout one-third of 1 per cent of domestic production. dom, the Netherlands, Germany, and Norway were rces. After 1915 imports of book paper practically , when they amounted to 681 tons, or less than one- nt of domestic production.

was sometimes made that because of the raising of ndutiable value of printing paper to 8 cents per pound, r was allowed to enter free of duty. This amount, ry small. In April, 1922, according to the provision aised the limit to 8 cents, the maximum nondutiable) 5 cents.

PRICES.

ıs has been pointed out, the great bulk—about 90 .e newsprint paper output on the North American ught by publishers of the larger dailies on contracts or the delivery of a certain tonnage at a fixed price. is sold on the open or "spot" market, which means mainly through brokers or jobbers and to a small ɔm mill to customer without previous contract.

l table (p. 48) shows the weighted average price, by vsprint paper standard rolls, in carload lots, f. o. b. aid by American publishers for all the contract news- rchased by them in the United States from January, t, 1922. From January, 1913, to June, 1916, the price steady at slightly less than 2 cents per pound. In July, to rise and continued rising until May, 1917, reaching here was little change during the remainder of 1917. uarter of 1918 there was a slight decrease. Between ıy, 1918, it increased once more, reaching a level of 3.75, which it maintained until the fall of 1919, when reasing. This increase continued into 1921. The for January, 1921, was 6.08 cents, after which it de- y to 3.52 cents in August, 1922.

)f contract newsprint has been nominally fixed since

On November 26, 1917, a combination of newsprint s was ordered dissolved under the Sherman Act as a rand jury investigation conducted by the Attorney e charge was that the combination aimed to restrain ontrol prices. On the same date certain of the defendant entered into a formal agreement with the Attorney viding that beginning April 1, 1918, prices and terms r the sale of newsprint paper on the part of the signatory ould be fixed by the Federal Trade Commission, subject the circuit judges of the second circuit. The Federal ission fixed the price of contract roll news in carload mill at 3.10 cents per pound, effective April 1, 1918. judges reviewed the price schedule of the commission d the carload price of newsprint to 3.50 cents. The

price for May and June, 1918, was fixed by the commission at 3.63¼ cents per pound. The maximum price effective July 1, 1918, was fixed at 3.75¼ cents, since which time there has been no change. This price and the others in the schedule, however, are now purely nominal, for it was understood in the agreement between the Attorney General and the paper manufacturers that more than the fixed price might be charged if the customer was willing to pay the additional amount. As the publishers in 1920 were practically competing with each other to secure enough newsprint to enable them to keep running, they were glad to pay considerably higher than the Government fixed price in order to make sure of a steady supply.

Another appended table (p. 49) compares by months from May, 1919, to August, 1922, the American contract prices referred to above with the average prices paid by American publishers on their contracts with Canadian producers and with American open-market prices. In all cases the prices given represent the weighted average of prices actually paid by American publishers.

Comparing American and Canadian contract prices, little difference is to be noted up to 1921, although before then in most cases the Canadian price was slightly lower. This tendency was the most clearly marked from May to December, 1920, when the Canadian price averaged 4.4 per cent lower than the American. Yet from January to March, 1921, the average Canadian price was considerably higher than the American price. Also, although the February and March domestic prices represented a slight decline from the January peak, the Canadian price increased successively in both these months. March represented the peak price for Canadian contract deliveries to the United States. In April the Canadian price fell abruptly by almost a full cent to a point just barely above the American price. From April to July the Canadian price remained higher than the American, but during the rest of 1921 and the first eight months of 1922 the American price was slightly higher.

In spite of Canada's advantage in cost of production, American and Canadian newsprint prices in the American market are about the same. The following table of comparative prices charged on their 1920, 1921, and 1922 contracts by the International Paper Co. and the Canadian Export Co., the principal purveyors of newsprint in the United States and Canada, respectively, shows how closely the American and Canadian prices hang together. It will be noticed that during 1920 the prices of the latter tended to be slightly in the lead of those of the Canadian Export Co., but that the two reached their peak at the same time and have declined together.

-market price.
et stringency of the summer lessened, the spot price
Iarch, for the first time, it went below the contract
aged 5.21 cents in April, 1921, compared with an
ct price of 5.41 cents. This fact was a potent influ-
rease in contract prices made in April, 1921. During
mainder of 1921 and the first eight months of 1922
was lower than the contract price.
—From 1910 to the first part of 1916 the prices of book
remely steady, varying from 3½ to 3⅞ cents per pound
ıish, 3¾ to 4 cents for sized and supercalendered, and
r coated and enameled. During 1916, in company with
odity prices, these prices practically doubled; they
ewhat during 1917, but not to their earlier level. They
n during 1918 and decreased during the early part of
second half of 1919 book-paper prices began an almost
which reached its peak about August, 1920, when they

stood as follows: Machine finish, 14 cents per pound; sized and supercalendered, 15 cents per pound; coated and enameled, 18 cents per pound.[8] The high level lasted through October, but with the coming of the business depression prices decreased rapidly. The decrease continued slowly during 1921 and the first part of 1922 until in April, 1922, they stood as follows: Machine finish, 6 cents per pound; sized and supercalendered, 6.7 cents per pound; coated and enameled, 8 cents per pound. After April, 1922, prices began to increase slowly. In the latter part of the summer of 1922 all prices were withdrawn in anticipation of a considerable increase.

TARIFF HISTORY.

Tariff acts, 1883 to 1913.—Until 1897 the tariff laws did not distinguish newsprint from book paper. The acts of 1883 and 1890 both subjected unsized printing paper to a 15 per cent ad valorem duty and sized or glued printing paper to a 20 per cent ad valorem rate. The act of 1894 made this rate 15 per cent for all printing paper, unsized, sized, or glued. The act of 1897 introduced an elaborate sliding scale, newsprint being included mainly under printing paper valued at not above 2 cents per pound. Specific duties were placed on all classes except printing paper valued at above 5 cents per pound, on which the old rate of 15 per cent ad valorem was continued. The actual average equivalent ad valorem duty collected on printing paper under the 1897 tariff in the fiscal years 1907 to 1909 was slightly over 16 per cent in the case of newsprint paper and slightly over 15 per cent in the case of book paper. Thus the act of 1897 made practically no change in the actual average rate of duty collected.

The changes since 1897 have been downward. The act of 1909 lowered the duties on newsprint paper and the cheaper grades of book paper, valued not over 4 cents per pound. The Canadian reciprocity act of July 26, 1911, admitted these grades free from Canada. The benefit of this act was extended by court construction to certain European nations under most-favored-nation agreements. Both of these acts, however, retained the 1897 rates on paper valued over 4 cents per pound. The act of October 3, 1913, removed the duties on all printing paper valued up to 2½ cents per pound, in which class practically all newsprint was included, and lowered the duty on printing paper worth more than 2½ cents per pound, which comprised book paper, to 12 per cent ad valorem. Since then the maximum nondutiable value has been raised twice because of the increasing price of newsprint—once to 5 cents on September 8, 1916, and again to 8 cents on April 23, 1920, with the proviso that in two years it return to 5 cents.

Beginning with 1897, each tariff act has contained a provision for countervailing or additional duties or both on printing paper from any country placing duties or restrictions on exports of newsprint or its raw materials. This has been due to the agitation begun in Canada about 1897 to impose an export duty on or otherwise restrict pulpwood shipments to the United States.[9]

---

[8] For the causes of this rise see p. 18.

[9] See Tariff Information Survey, Wood Pulp, for detailed treatment of Canadian provincial pulpwood embargoes.

imposed a countervailing duty on printing paper
of an export duty placed by some other country on
l to the United States. The countervailing duty

IONS OF FOREIGN AND DOMESTIC COMPETITION.

NEWSPRINT.

ition.—In the year 1920 consumers throughout the
ed for newsprint paper. The shortage was felt wherever
nting was an important industry. In certain European
sizes of newspapers were drastically cut and Govern-
ng was resorted to. Under conditions like these the
oducers of one country need not fear competition from
es, for every producer, even though his cost of produc-
ively high, has a ready market at a profitable price.
, in 1920 the American newsprint industry, aside from
with Canada, was practically free from foreign competi-
the latter part of 1920, however, world demand has not
enough to absorb the full capacity production of the
print industry. Particularly in Europe has the decreased
n felt. As a result, toward the end of 1920, Germany
ndinavian countries, in order to keep their mills running,
to the United States and to the export markets of the
es. The American newsprint industry quickly felt the
eign competition. Whereas in 1919 imports of newsprint
e equaled less than one-hundredth of 1 per cent of domes-

tic production, in 1921 newsprint imports from Europe equaled 17 per cent of domestic production. Newsprint exports decreased from 8 per cent of production in 1919 to 1.4 per cent in 1921. It was imports from Europe in combination with decreased exports that in the spring of 1922 prevented the unprecedented domestic demand from bringing about a market shortage similar to that of 1920.

With newsprint remaining on the free list it is highly probable that imports from Europe will continue. A corporation has recently been formed in New York for the purpose of marketing in the United States the product of certain Scandinavian newsprint mills. As closer contacts between European producers and United States consumers are established, European mills will become better able to suit the exact requirements of United States newspapers. The North American newsprint industry must henceforth reckon on competing in its domestic market with substantial shipments of European newsprint.

More important in the long run than the question of the distribution of sales of newsprint among the different countries of the world are the questions: (1) Whether or not the demand of the world as a whole for newsprint is to increase or decrease, and (2) how the world's supply is going to adjust itself to the demand.

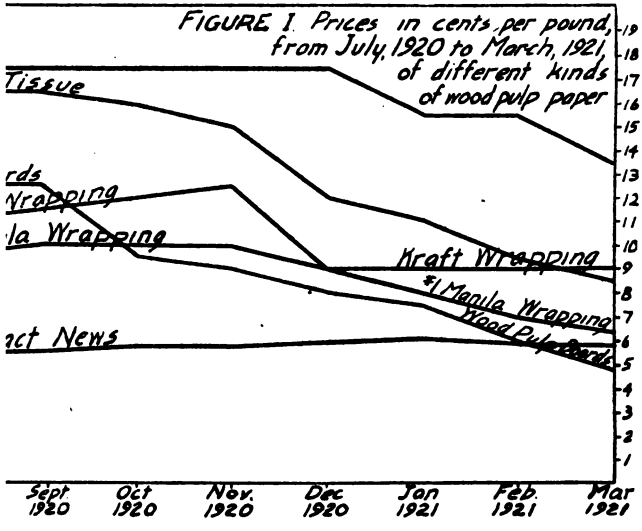
So far as demand goes, the future seems assured. It may be assumed that as the masses of people in the world become more educated, newspaper reading will steadily expand. The experience the selling world has had with large-scale advertising is such as to make likely an extensive newspaper advertising in the future. The decline in demand for newsprint, although unquestionably taking place in the early part of 1921, was less bound up in the general business depression, which at the start of 1921 had already been prevailing for some months, than was the case with the majority of commodities. It came much later than the fall in general prices and was small in comparison. The adjustment of the industry to the decrease in demand was accomplished with none of the throes experienced in many other industries. At the time the first important decreases in the price of contract newsprint in the United States were announced (late February and early March, 1921) the American industry was reported to be working at practically full capacity.

American consumption of newsprint in 1921 was very little less than in 1920, and amounted to considerably more in the first eight months of 1922 than in the corresponding period of 1920. In April, 1922, there was recorded the greatest consumption of any month in the history of the United States up to that time.

The demand for newsprint is based on factors somewhat different from those which influence the demand for most other commodities. The average man's purchase of newspapers is perhaps as great in time of business depression as in time of business prosperity, for he ordinarily does not consider decreasing the amount of news he reads as a means of financial retrenchment. In other words, the purchasing power of the eventual consumers of newsprint is a more or less stable affair, influenced more by such factors as an improvement in public education or an awakening of interest in the affairs of the world than by the factors contributing to cycles of business prosperity and depression. Also the demand for advertising space, although intimately connected with business competition, does not necessarily vary with

ısiness being transacted by the advertisers. The ısing is part of the total cost of the production and mmodity, just as is the cost of raw materials or of a depression in the demand for that commodity the demand for the raw materials and labor entering dity, while the amount of advertising done is not ısed. It is likely to be large during a period of was in the spring and summer of 1920, especially roducers and distributors think they see a buyers' ·izon, yet a business man may find it desirable to ›avily at a time when it is hardest to dispose of his ınce, the record consumption of the spring of 1922 ıtes took place at a time when industrial conditions till depressed.

position of newsprint paper in relation to demand he movement of contract newsprint prices in the



from July, 1920, to March, 1921, compared with the the prices of other important grades of wood-pulp he same period. Inasmuch as the conditions of superials and processes of production are almost the same kinds of paper using new wood pulp as a raw material, reflected by the comparative price movements are on the side of demand. The figure above portrays these graphic form. The prices for grades other than news- ıach case, those charged by some particular company ıcular grade made by it, and are used here as repre- ıe trend of the market for manila and kraft wrapping ›ulp blotting and tissue paper, and wood-pulp boards ıriod concerned. The prices indicated are not in any ıen as indicative of the relative values of the different ır as classes. The price for contract newsprint is the rage price of contract standard rolls actually paid by ›lishers during the whole of each month concerned.

The diagram shows the strength of the newsprint market in comparison with the market for most other grades of wood-pulp paper. Where, in general, the latter sagged deeply and a large number of the mills producing these kinds of paper were forced temporarily to shut down, the price of contract newsprint from domestic mills increased steadily up to January. It decreased a trifle in February and March. However, the average price of Canadian deliveries of contract newsprint to the United States (not shown on the diagram) continued to increase steadily to a peak in March.

The fact that the spot price of newsprint in March, 1921, was only about half what it was in the summer of 1920 indicated that the large newspapers had ceased buying in the open market and that the small newspapers, consuming 10 per cent of the newsprint used in the United States, could easily buy their necessary supplies. The decline in the spot price beneath the contract price forecasted a small decrease in the latter, for it naturally initiated a tendency to rely on the spot market for a part of the supply previously purchased on contract. However, it is evident that the amount of additional demand which the spot market can supply without an immediate increase in price, far beyond the level of the contract price, is severely limited; the case is analogous to the movement that would take place between two containers filled with water, one nine times as large as the other, connected by a pipe, the level of water in the smaller being 1 inch or so lower than the level in the larger one. The flow of water resulting would add an inch to the level in the smaller container, but the level in the larger container would fall only one-ninth of an inch.

Thus, as far as we can forecast, the world demand for newsprint paper, although not likely soon again to produce such a shortage as in 1919–20, when in a great many lines producers and distributors alike throughout the world were selling on a highly speculative market, is likely to be stable and dependable.

The question of supply is perhaps more difficult to forecast. A suddenly increased demand for a commodity with its resulting high prices and abnormal profits, ordinarily calls forth an increase in production. Under this new condition we have manufacturers whose cost of production, had they produced in the days of the older, smaller demand, would have meant producing at a loss. Then, if the demand recedes, these marginal producers are forced out of business, there is an oversupply, and cutthroat competition prevails between domestic producers within a country and between different countries. So goes frequently the course of a shortage in a commodity.

In the newsprint industry, however, as we have seen, the transition to a less extraordinary basis was accomplished, at least in the United States, with little temporary maladjustment. One reason is that it takes practically two years to put a new newsprint mill into operation, so that there had not been much opportunity for the expansion of plant capacity to meet the increased demand. Another reason is that when the demand was heaviest certain paper machines normally manufacturing other grades of paper were diverted to newsprint making, although making it often at a relatively high cost. When the demand declined these machines could again be used to make the paper they originally made. There was to this extent flexibility of plant capacity to accord with demand.

A more fundamental reason is that the wood-pulp and paper industry of the world has reached a point where it is much harder than in

cure the requisite supplies of pulpwood. This fact
in the last decade in the United States through the
se in production. Canada and Finland still have
wood, but they are being used at an ever-increasing
d Norway are already practically at the limit of
development of the forests of Russia and such
laska has so far not offered sufficient return to be
extensive scale. These areas can be made use of
production and transportation to consuming centers
the regions where pulp and paper are now made.[10]
former Chief Forester of the United States, says as
our lumber and pulpwood resources:

krupt and we do not know it. Because there has always been
ound, we have placidly assumed that there always would be,
ts are against us.

nd the supply factors hence unite to make likely for
me a strong position of wood-pulp papers, particu-
in the world's markets. Unless some satisfactory
od pulp is discovered, the world will soon be forced
d production on a scientific crop basis, as has already
tain countries, in order to insure against a steadily
of paper. Such action, however, even if begun now,
effect for 20 or 30 years on the supply of pulpwood,
nood during that time of serious overproduction of
rs is small. A few decades hence, when pulpwood is
vested as grain is cultivated, supply conditions may
and there may be danger of overproduction, though
able.

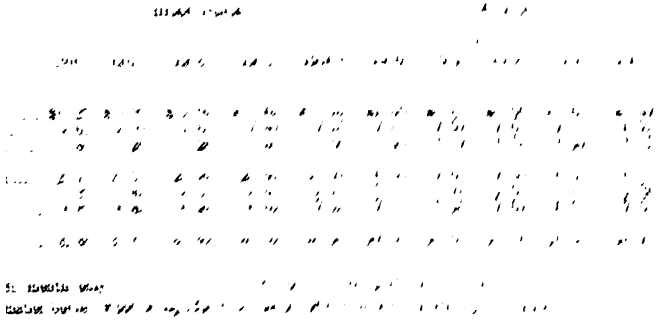
of newsprint paper, not including depreciation allow
nited States and Canada and U. S. in 1910, as determined
States Tariff Board, and for the years from 1912 to the
U. as given in a study by the Federal Trade Commission

Average cost of manufacture



In dealing with figures for average cost of production it must, of course, be borne in mind that the manufacturers are actually producing at widely varying costs. Thus in the United States the costs of 35 of the principal newsprint mills varied from $25.77 to $44.41 per ton for different mills in 1915 and from $24.93 to $46.94 per ton (including depreciation) in the first half of 1916. Nevertheless, average figures more or less satisfactorily represent the general trend of cost conditions.

It will be noted that from 1910 to the middle of 1916 there was a slow but unbroken decrease in the cost of production in the United States, and that the Canadian cost, although slightly higher in 1913 than in 1910, declined steadily from 1913 to 1916. In April, 1918, it was estimated that the average cost of producing newsprint in all important mills in the United States and Canada combined had risen to $56 per ton. In the latter part of 1919, however, according to the Canadian Government auditor, the cost of production in the more efficient mills of Canada was only about $50 per ton.

The estimate of the present cost differential in favor of Canadian newsprint mills is about 10 per cent as generally accepted. The last detailed comparison is the one presented in the above table. In each of the years in question the Canadian cost was considerably lower than the American cost, ranging from $25.71 to $28.63 per ton, in comparison with a range of $30.23 to $32.88 for the United States.

The items mainly responsible for this differential were ground wood and sulphite, although Canadian labor was also less expensive than American labor. The proportions of total Canadian to total American costs in the period covered and also the relative proportions of costs of raw material were as follows:

Ratio of Canadian to American cost.

Year.	Total.	Materials only.
	Per cent.	*Per cent.*
1910	83.7	74.3
1913	90.2	82.8
1914	89.6	85.5
1915	86.4	82.6
1916	85.0	82.7

Canadian costs of material ranged between 15 and 26 per cent lower than American costs of material, while the total cost of production ranged from 10 to 16 per cent lower in Canada than in the United States.

An idea of the relative importance of particular items entering into the cost of newsprint paper can be gained from the following table showing the average ratio of the cost of each item to the total cost in American and Canadian mills combined in the first half of 1916:

Stock:	Per cent.
Sulphite	23.36
Ground wood	34.30
Filler	.80
Alum	.63
Sizing	.21
Miscellaneous	1.96
Total	61.26

constituted over three-fifths of total expense, while conversion of pulp into paper was only 10 per cent. ntry which has relatively cheap supplies of wood dvantage, for the cost of ground wood and sulphite utes 58 per cent of the total cost of production, ciation allowance.

ntage, then, lies principally in her lower cost of the main, her newsprint mills use wood pulp made hemselves, while American mills either manufacture gher cost than that of the Canadian mills or purchase narily a higher cost than that for which they could es.

wood-pulp production cost is, in turn, due almost ie lower cost of her pulpwood. There are several Canada has the advantage of greater accessibility , with consequently a smaller expense for transpor- and other pulpwoods grow most plentifully in the s can be readily floated to the mills on the numerous eams of the Provinces. This is a much less expensive l transportation, which is necessarily used by most of a the United States. Again, Canada has the immense ing able to use pulpwood from the extensive stands own lands, the export of which to the United States forbidden.[11]

l provincial governments have encouraged develop- od areas by leasing Crown lands and water powers s, by establishing fire-protection systems, by building dwaters, and by certain beneficial regulations relative

a Canadian pulpwood production cost is a result of of the three components into which the production mmodity resolves itself—labor cost, return to capital, the raw material in the ground, or wherever it origi- first place, the mere increase in Canadian wages to es level, which is generally admitted to have occurred, tion of about the same average capacity on the part

ion Survey, Wood Pulp, p. 26.

of the laborers of the two countries to work and to work efficiently, do not necessarily, and do not in this case, mean the same labor cost per ton. The reason for this is that, because of the greater accessibility of Canadian pulpwood and the easier means of transportation available as compared with the United States, Canadian mills are able to dispense with a considerable share of the labor necessary for getting pulpwood to American pulp mills. It is just a case of using less labor per ton of output, not a case of using the same amount and paying each unit less.

Thus the labor cost of getting out the pulpwood in Canada remains smaller than in the United States, in spite of the fact that wages in the two countries may now be regarded as approximately equal and independent of the question of relative labor efficiency, which is a controversial one.

The other factors causing Canada's cost of pulpwood to be lower are the differentials in the other two components of production cost above mentioned. One is closely linked with the saving in labor cost—it is the saving on return to capital (tools, machinery, railroads, etc.) resulting from the fact that fewer services of capital are required in Canada to get the pulpwood to the pulp mill. The third, and probably the most important of them all, is the low cost at which most of the Canadian newsprint companies acquired large tracts of pulpwood timber in Canada and the low cost at which they are able to hold it for future use, in contrast with the situation of certain important American companies which are forced through their own inadequate holdings of pulpwood stands and by the Canadian provincial pulpwood export embargoes to secure their pulpwood from the reduced woodlands of the United States or from the fee lands of Canada—in either case at a cost much higher than that of their Canadian competitors.

It will be noted that in the main these three components of saving in pulpwood production cost in Canada as compared with the United States have their basis in the advantages to the Canadian mills of accessibility to the pulpwood areas and of freedom to use their large holdings of Crown-land timber, bought cheap, as well as in the advantages conferred through governmental interest in the development of the Canadian pulp and paper industry.

Another factor, in addition to the smaller cost of raw materials, apparently is in favor of Canada. In 1911 the United States Tariff Board found that on the average the efficiency of equipment was slightly greater in Canada than in the United States. In the last decade this efficiency differential has undoubtedly increased, for during that time Canada has multiplied her output many times through building new mills and installing up-to-date machinery, while very little extension of plant has taken place in the United States. We have seen that Canada possesses a much greater proportion of wide and fast-operating paper machines than the United States. [12]

The two factors discussed—the lower cost of pulpwood to Canadian mills and the superior efficiency of Canadian paper-mill equipment—are apparently the only important differentials in Canada's favor at the present time, for wages are now about the same in the two coun-

[12] See section on Equipment, p. 8.

the time the cost figures given in the table on led the factor of comparative labor cost was of causing Canada's paper production cost to be

nsiderably greater effect on the total paper cost vo countries than would be indicated merely by accounts for only 10 per cent of the cost of con- aper. The percentage of cost of production of ributable to cost of labor increases the further he processes of production. Compounding the ages during the various processes of conversion he ground to the finished paper results, of course, proportion of total labor cost to total cost of pro- r than the proportion of labor in the single process lp into paper.

ward equalization of the wage scale of the two ably been the principal factor in bringing Canada's of 15 per cent lower cost of newsprint production mated as 10 per cent. It should be remembered, labor is required per cord in Canada than in the get the pulpwood from the forests to the mills. emains in Canada's favor.

anadian export trade.—Canadian overseas export of n gaining on American overseas trade. The follow- anadian overseas exports of newsprint in the years 1919 to 1922, compared with American overseas endar years 1918 to 1921:

Calendar year.	From United States (short tons).	From Canada.	
		Year ended Mar. 31.	Short tons.
	94,243	1919	[1] 68,337
	108,325	1920	85,958
	44,848	1921	86,788
	16,180	1922	51,610

proportion of book paper.

arent that Canada's export trade survived the world 21 in much better condition than did the American

ended to concentrate, apart from her shipments to es, on British dominions, while United States news- mainly to Latin-American countries. Nevertheless, by y be said that the Canadian overseas export trade and xport trade unite to form the foreign business of one try—the North American newsprint industry, the becoming more important as Canada's proportion of rint output of the continent increases.

American-Canadian competitive relations. In sum- mpetitive relations of Canada and the United States,

it should once more be emphasized that only technically are we dealing with an international issue. In actuality, a large part of the newsprint trade between Canada and the United States is between Americans north of the border line and Americans south of the border line, the Canadian newsprint industry being in considerable degree a northward extension of the American newsprint industry, made with the help of American capital.

The present condition is quite similar to competition between two sections of the same industry, such as might exist between two geographical sections entirely within the United States, one of which has an average lower production cost than the other. In times of depression the low-cost section is naturally able to do the better business, both in its domestic and in its overseas sales.

Nevertheless, even though our relation to the Canadian newsprint industry is not one that easily lends itself to adjustment through the tariff, it is fraught with great significance as regards the future of the industry. The Canadian industry is bound to become increasingly important, for the American industry is becoming more and more remote geographically from the main sources of pulpwood supply, and Canada is determined to make the most out of her possession of large pulpwood forests, keeping them as far as possible for her own industry to the exclusion of the American industry. American newsprint companies must manufacture increasingly in Canada, or at least establish their pulp mills there, even if access to Canadian Crown-land timber is made freer.

The fact is that, except for certain companies in the United States which have adequate pulpwood holdings in Maine and certain companies near the Canadian border which foresightedly provided themselves early with large tracts of freehold pulpwood lands in Canada and because of their comparative nearness to these supplies can transport their pulpwood reasonably cheaply, the American newsprint industry, as far as it is confined to the northeastern portion of the United States, has seen the end of expansion for many years to come.

Canada will almost inevitably soon produce more newsprint than the United States. In time Alaska and perhaps the western part of the United States will develop newsprint production on an important scale. But they will always be handicapped by the fact that they are farther distant than eastern Canada from the main consuming markets.

Significance of transportation factor.—So it is that the factor of transportation together with the economies of integration of both the process of pulp making and the process of paper making are the ultimate factors determining the order of development of the pulpwood areas of the world and the dates of moving on to new areas. Factors like sudden changes in tariff, for example, putting Canadian newsprint imported into the United States on the free list in 1911, and excluding the main pulpwood supplies of one country from its more highly industrialized neighbor, though exerting much influence on geographical shifts in the industry, are of minor importance in the long run.

The high cost of transportation of logs always causes the wood-pulp industry to be located near the pulpwood forests; naturally the forests nearest the newsprint-consuming centers are chosen. The newsprint

then located close to the wood-pulp mills because
ved thereby in the process of manufacture, and
to transport the finished newsprint than it does
lp. As the forests recede from the mills the tend-
d-pulp mills to follow them. Artificial national
tariff measures and pulpwood embargoes, tend to
ement, as they did beginning about 1910 in the
nt of American capital into Canada. As the pulp
the receding forests, the newsprint mills, though
follow in their turn. They tend to stay near the

See section on Tariff page 28.	Free.

COURT AND TREASURY DECISIONS.

PRINTING PAPER.

The term "handmade" as applied to paper by paragraph 401 of the act of 1897 was declared to be precise, explicit, specific, and controlling, and handmade paper weighing 10 pounds to the ream was declared to come within that paragraph rather than paragraph 396 for printing paper suitable for books. (American Trading Co. *v.* United States, 2 Ct. Cust. Appls., 237, of 1911.)

The word "suitable" in the phrase "suitable for the printing of books and newspapers" means actually, practically, and commercially fit. An exceptional use of onionskin paper for printing purposes does not make it a printing paper. (Kahlen *v.* United States, 2 Ct. Cust. Appls., 206, of 1911.)

Printed paper advertising cards, having the outline of a picture die cut into them after the manner of a stencil, were held properly classified under the proviso to paragraph 415 of the act of 1909 and not dutiable as printed matter under paragraph 416. The proviso to paragraph 415 was declared to have been prompted by the decision of the United States Circuit Court of Appeals for the Second Circuit in Hamilton *v.* United States (T. D. 29519, of 1909). (Knauth *v.* United States, 3 Ct. Cust. Appls., 183, of 1912.)

A protest claiming printing paper to come within paragraph 322 of the act of 1913 need not deny that it came from a country imposing an export duty upon it or upon the material used in its manufacture. (United States *v.* Murphy & Co., 7 Ct. Cust. Appls., 35, of 1916.)

Kraft paper is wrapping paper and not printing paper. Whether it is wrapping paper and not printing paper may be determined by trade testimony, but whether or not it is suitable for books is a question of fact not dependent upon any trade understanding. (Pritchard & Co. *v.* United States, 2 Ct. Cust. Appls., 247, of 1911.)

"Normandy vellum" was held not so imitative of the genuine japan as to be readily recognized as a substitute therefor, and is not a japan paper nor an imitation of japan paper, but is book printing paper. (Abstract 25317, T. D. 31498, of 1911.)

Countervailing duty was assessed under the act of 1913 upon printing paper imported from British Columbia, Finland, Portugal (T. D. 33786, of 1913), Labrador (T. D. 35741, of 1915), and Italy (T. D. 37204, of 1917). An affidavit of the seller or shipper stating the name of the country of manufacture and Province in which the wood was grown that was used in manufacturing the paper, may be accepted in lieu of a declaration showing the name of the manufacturer and the place of manufacture. (T. D. 34449, of 1914.)

Newsprint paper from Canada, valued in the Canadian market at 4 cents per pound, was held to be entitled to free entry as newsprint paper valued under 5 cents per pound by virtue of the provisions of paragraph 567 of the act of 1913, as amended by the act of 1916, and not dutiable under paragraph 322 of said act as amended by section 600 of the act of 1916. (Abstract 44126, of 1921.)

PREFACE.

This is one of a series of Tariff Information Surveys prepared by the ited States Tariff Commission and transmitted to the Committee Ways and Means. The series covers all of the articles and com-dities provided for in the tariff act of October 3, 1913, and others specifically provided for. It is arranged in the numerical order paragraphs of that act.

In some cases two or more paragraphs have been combined in one nphlet. In doing this, industrial relationship of the articles has n followed, when possible. In those instances where a paragraph been treated under a preceding paragraph of the tariff act, erence is made to this fact at the point where the paragraph pears in numerical order. Where one grade of an article is dutiable l another grade of the same article is on the free list, the article discussed under the dutiable paragraph which appears first in merical order in the tariff act. In certain instances articles of se industrial relationship and which occur in separate paragraphs the tariff act have been combined under one paragraph for con-nience of discussion. Reference is made to this fact at the point ere the commodities would naturally occur in numerical order.

The first pamphlet in the series is an "Introduction and index" ich contains:

. An introductory chapter discussing the scope of the series and general method of treatment.

. An alphabetical index of the articles provided for in the tariff of 1913, showing the paragraph of the act in which the article is vided for and, if discussed under a different paragraph, the number uch paragraph.

. A list of the pamphlets in the series, showing the paragraphs and cles included in each pamphlet.

Thus, by use of this "Introduction and index," the exact location the discussion relating to a given article or commodity can be ertained.

n the preparation of this report the Tariff Commission had the vices of Evelina P. Kean, of the Commission staff, and of others.

WEARING APPAREL AND SILK SMALL WARES.

TARIFF ACT OF OCTOBER 3, 1913.

Schedule L, providing for silk wearing apparel and silk
s:

kerchiefs or mufflers composed wholly or in chief value of silk, finished
l; if cut, not hemmed or hemmed only, 40 per centum ad valorem; if
or imitation hemstitched, or revered, or having drawn threads, but
ered in any manner with an initial letter, monogram, or otherwise, 50
ad valorem.
ons, bandings, including hatbands, belts, beltings, bindings, all of the
t exceeding twelve inches in width and if with fast edges, bone casings,
s, cords and tassels, garters, suspenders, tubings, and webs and webbings;
going made of silk or of which silk or silk and india rubber are the com-
erials of chief value, if not embroidered in any manner, and not specially
r in this section, 45 per centum ad valorem.
hing, ready-made, and articles of wearing apparel of every description,
knit goods, made up or manufactured in whole or in part by the tailor,
or manufacturer; all the foregoing composed of silk or of which silk or
dia rubber are the component materials of chief value, not specially pro-
n this section, 50 per centum ad valorem.

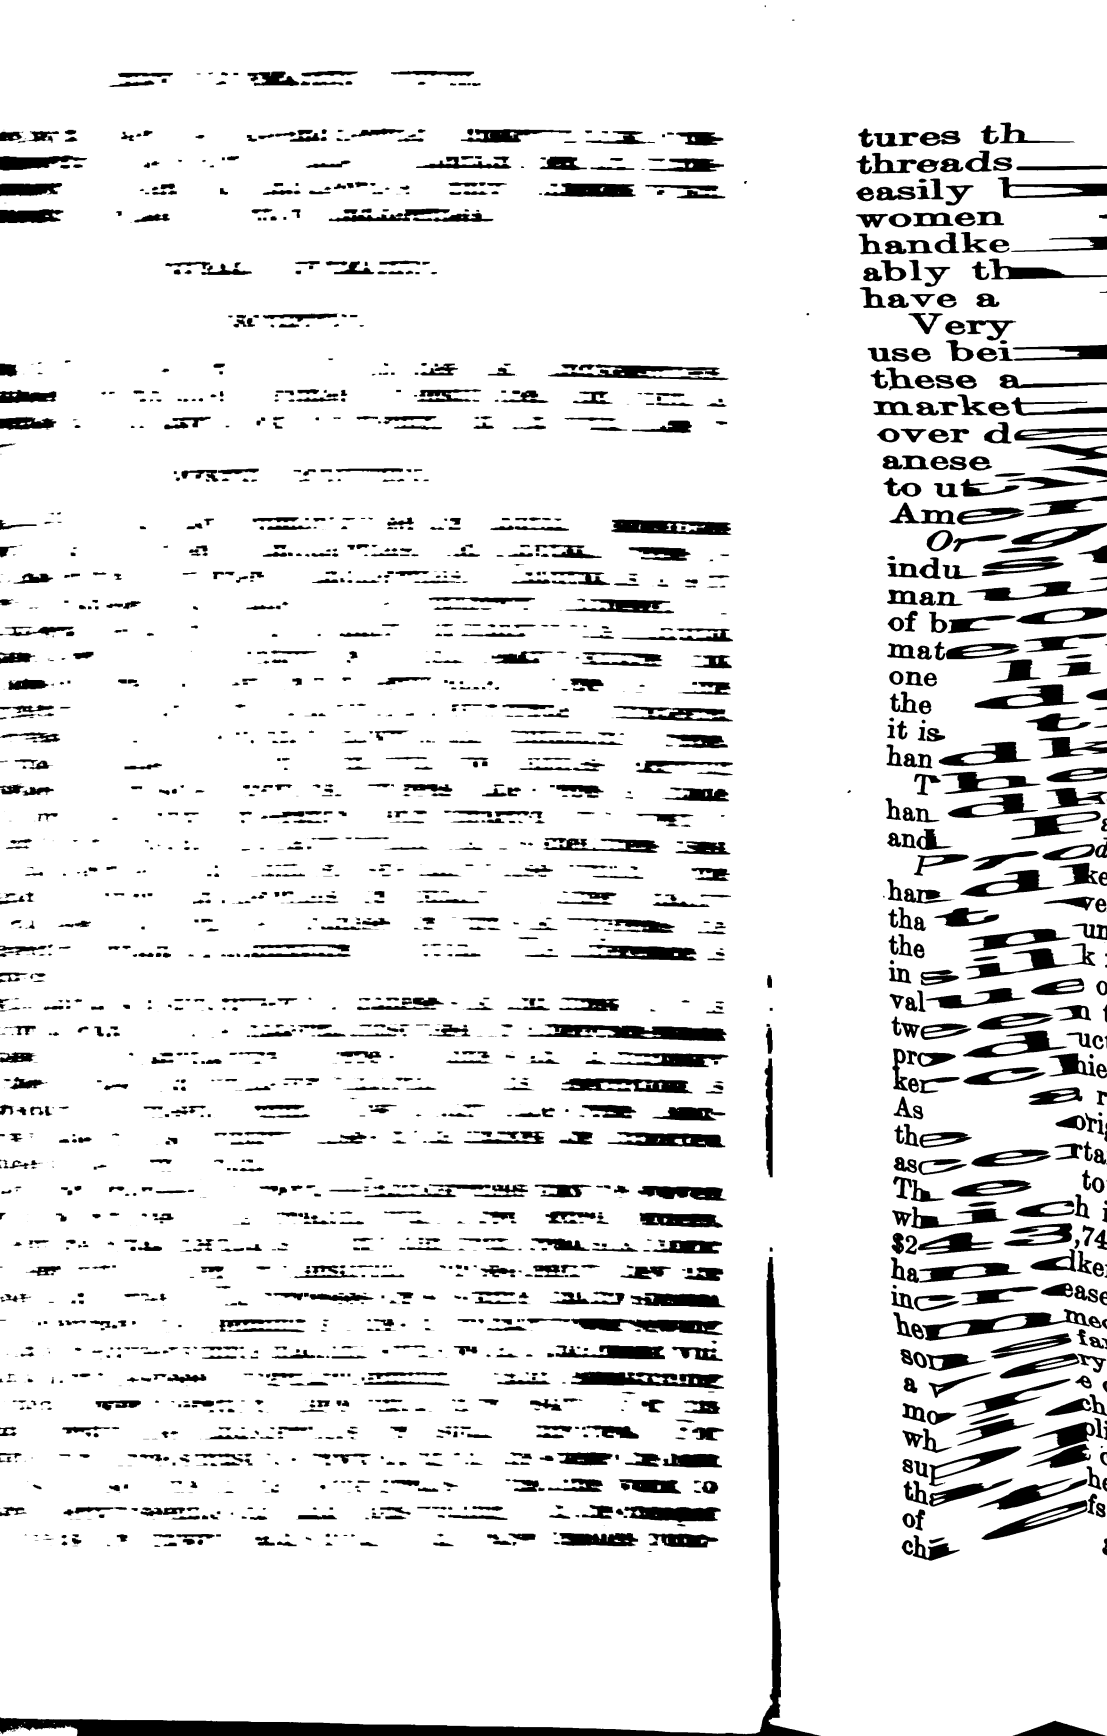
SILK HANDKERCHIEFS.

SUMMARY.

manufacture of silk handkerchiefs has never been of very
nportance in the United States. It is not a separate indus-
t connected with the manufacture of broad silks or the manu-
of other kinds of handkerchiefs. For this reason the chief
are Passaic and Paterson, N. J., where handkerchiefs and
re made.

demand for silk handkerchiefs is so variable from year to
hat there is little to induce the investment of capital in a plant
eir manufacture.

orts represent the larger part of the domestic consumption,
is much less than that of other kinds of handkerchiefs. The
ge imports of silk handkerchiefs for the 10 years 1911–1920
equaled in value the imports of cotton handkerchiefs, but
omestic production of cotton handkerchiefs in 1914 was about
00,000, while the production of silk handkerchiefs was prob-
less than $1,000,000. Silk handkerchiefs are the only kind
hich the imports of the plain article average more than imports
ie ornamented. This is probably because such a large propor-
of the silk handkerchiefs are printed. These are usually a
p habutai handkerchief, which comes in large quantities from
an at an average price of less than $1 per dozen. France, Switzer-
l, and Great Britain send small amounts of high-priced goods.



›ric giving a line of perforations which simulate drawn
ıese machines are not difficult to operate and may
ın by semiskilled labor. The operatives are usually
rls. Quantities of plain hemmed and machine hemstitched
ıfs are among those imported from all countries and prob-
›rk has been done on American-made machines which
› market in all parts of the world.

plain white silk handkerchiefs are in demand, the greatest
s an accessory to sports attire. Some are in solid colors;
sually crêpe de chines, but the silk handkerchiefs on the
for the most part printed either with borders or all-
s, in one color or in a combination of colors. The Jap-
kerchiefs are hand-printed with blocks, making it possible
great variety of designs and of colors in one design. The
ınd European printing is done by machine.

tion and geographical distribution.—The silk handkerchief
not an entity in this country. It is correlated with the
re of cotton and linen handkerchiefs and the manufacture
lks. For this reason the fluctuation in demand does not
affect the manufacturer, because he can quickly shift from
› another; if the demand for silk handkerchiefs is slack,
ıd for cotton and linen proportionately heightens. Thus
he competition offered by the importation of cheap silk
iefs is with the whole domestic handkerchief industry.

ıs manufacturing silk handkerchiefs are in or near the
ief and silk manufacturing centers, particularly at Passaic
›on, N. J.

›on and consumption.—No production statistics of silk
ıiefs are available, but observation of the trade reveals
few domestic silk handkerchiefs are sold in comparison with
›r imported. Only the silk handkerchiefs which were made
lls were recorded in census reports. These amounted to a
›267,910 in 1909 and $76,477 in 1914. The difference be-
figures does not necessarily mean a decrease in domestic
ıı, because several manufacturers of cotton and linen hand-
also make silk handkerchiefs, which would not be included.
›, the product is not classified according to material on
.al returns to the Census Bureau, so it is impossible to
the total value of silk handkerchiefs made in this country.
. production is evidently less than the amount imported,
1914 was $370,955 and in 1920 was $1,947,796; of these,
in 1914 and $1,869,851 in 1920 were plain. The use of silk
hiefs, as attested by import for consumption statistics, has
several fold since 1914, and the increase is largely in the
or hemstitched group. From opinions gathered from per-
liar with the trade, the bulk of these importations consists of
ıeap grade of women's handkerchiefs printed in colors and
›n plain hemmed or hemstitched. These come from Japan
ı the two years for which imports are shown by countries,
over 98 per cent of the total quantity; the values from
ıtry show an average of less than $1 per dozen; hence some
would be imported at much lower prices. Such handker-
e found in quantities in stores specializing on cheap mer-

chandise, as the "10-cent" stores. Department stores and shops catering to high-class trade report a falling off in demand for women's silk handkerchiefs to such an extent that sales during the last several years have been negligible, reduced practically to crêpe de chine sport goods, which are usually a feature of the holiday trade. The use of men's silk sport handkerchiefs, on the other hand, has shown some increase, and as they retail at $1, $1.50 each, and higher, a small quantity imported in proportion to the women's handkerchiefs would add greatly to the total value. Demand also varies considerably according to locality. It is said that silk handkerchiefs are far more popular in the West than in the East, especially the large dark-colored ones which men wear as mufflers.

Exports.—The quantities of silk handkerchiefs exported from the United States are small and were not recorded in our trade figures until January 1, 1922. Small amounts are shown in foreign import statistics as coming from this country. Canada, for instance, received annually an average of about $8,000 worth of silk handkerchiefs from the United States in the five years, 1917–1921, and moderate quantities are sent to the Argentine. However, the United States is not really a factor in the world trade in silk handkerchiefs, about 90 per cent of which probably originates in Japan.

FOREIGN PRODUCTION.

The production of silk handkerchiefs in foreign countries can not be ascertained with accuracy, but from the statistics of countries which give this item separately it is apparent that Japanese exports represent a large proportion of the international trade. Argentina was an important market for silk handkerchiefs in pre-war days, imports amounting to from one to two million dollars annually. France and Japan together supplied 80 per cent of the total. Imports from France dwindled to a negligible amount during the war, and although those from Japan decreased they represented about 75 per cent of the total. The United Kingdom contributed somewhat to this trade but in a much smaller proportion than France and Japan. With the diminution of imports from France and Japan there was some increase in those from the United Kingdom. Canadian imports since 1913 have ranged from $51,630 in 1916 to $153,575 in 1921, the larger part of which was supplied by Japan in increasing proportions until 1921 when about one-third of the total came from Great Britain. The countries from which silk handkerchiefs are obtained, with the exception of Japan, do not separately state silk handkerchiefs in their export statistics. Japanese reports show large shipments to the European countries which are in turn exporters. This is particularly true of Great Britain which, next to Argentina, was the largest Japanese export market in pre-war days. From this it would seem that British shipments represent reexports rather than British manufactures. Considerable quantities were sent to France but not sufficient to account for silk handkerchiefs received by other countries from France. Italy and Germany also took large amounts from Japan. Hence it is probable that most of the silk handkerchiefs in international trade originate in Japan except perhaps some of special quality which are made in France. Total exports of silk handker-

[1] See *addenda*, p. 58.

Japan are between two and three million dollars
l by the time these handkerchiefs reach the countries of

cent by profits and transportation costs.

IMPORTS.

angement of classifications under various tariff acts
different grouping of the statistics so that a table of any
analogous throughout can not be given for a period of
ing over these changes. When studying the accompany-
imports for consumption the following points must be
nd: (1) The figures from 1891 to the first part of 1898,
e for all classes of silk handkerchiefs; (2) the figures from
part of 1898 to the first part of 1914, inclusive, represent
chiefs not hemmed or hemmed only; (3) the figures from
part of 1914 to 1920, inclusive, represent silk handkerchiefs
l, hemmed only, or hemstitched; i. e., the statistics were
the inclusion of hemstitched handkerchiefs which pre-
e reported with those embroidered or lace trimmed.
son Table 2, showing total imports of silk handkerchiefs
re period, is presented. This shows that the average for
s was $663,926 with an average annual duty of $366,703
rage equivalent ad valorem rate of 55.23 per cent. The
e of total imports recorded for any one year from 1891 to
290,630 in 1913 and the highest $1,947,817 in 1920. The
orts before the present tariff were $1,243,297 and $1,384,-
2 and 1893 respectively, and though imports fluctuated
y during the succeeding years they did not again reach
until 1917. In that year imports were $1,146,766, of
10,106 represented the value of plain handkerchiefs and
e value of those ornamented with lace or embroidery.
operation of the acts of 1897 and 1909 hemstitched hand-
ere grouped with ornamented, and this was a much larger
n than that of handkerchiefs not hemmed or hemmed
e the group containing plain hemstitched silk handker-
always been the larger, it is evident that the bulk of the
ve been handkerchiefs of this class. Silk handkerchiefs
nature of luxuries and the fluctuation in imports probably
change in fad or fashion rather than the effects of the
ie fluctuations do not correspond to the rising and lowering
tes. The domestic industry has probably never been of
portance to limit competition from abroad.
s of imports by countries were first recorded for the six
uly to December 31, 1918. During that period Japan
28,371 dozen, valued at $770,023, 93 per cent of the total
f silk handkerchiefs imported; and in the calendar year
7,294 dozen, valued at $1,529,127, 98 per cent of the total
The average unit value of the Japanese goods was 93 cents
1918 and 90 cents a dozen in 1919 as compared with $5 and
other countries. Imports from Switzerland showed the
nit value, averaging $33 per dozen in 1918 and in 1919,
tities were very small, probably consisting of elaborately
mented articles.

TARIFF HISTORY.

Silk handkerchiefs were not specially mentioned in the act of 1883, but were dutiable at 50 per cent ad valorem as manufactures of silk. No differences in rates were provided for silk handkerchiefs, whether plain hemstitched or ornamented with lace or embroidery, in the acts of 1890 and 1894, which levied flat ad valorem rates of 60 per cent and 50 per cent, respectively. Under the act of 1897 silk handkerchiefs not hemmed or hemmed only were dutiable at the same rate as the material of which they were composed, with a minimum proviso of 50 per cent; hemstitched and ornamented handkerchiefs were dutiable at 10 per cent ad valorem in addition to the rates on the cloth, with a minimum proviso of 60 per cent. As is usual when minimum rates are established, the bulk of the imports came in under that provision. In the act of 1909 the rates according to the structure of the cloth were abolished and only the flat ad valorem rates retained. A third classification of handkerchiefs ornamented with lace or embroidery made on a Lever or Gothrough machine, dutiable at 70 per cent, was included in this act in a paragraph providing for all articles so ornamented. There are three classifications under the act of 1913: Silk handkerchiefs if cut, not hemmed, or hemmed only are dutiable at 40 per cent; silk handkerchiefs hemstitched or imitation hemstitched, at 50 per cent; and silk handkerchiefs embroidered or lace trimmed at 60 per cent.

Apparently the tariff has had little effect upon imports. Under the 60 per cent rate of the act of 1890 imports were much heavier than under the 50 per cent rate of the act of 1894. The compound rates effective under the act of 1897 averaged somewhat greater than the 60 per cent rate of the act of 1890. Imports decreased under this act, but it was probably because of lessened demand, as there was no corresponding increase under the lower rates of the act of 1909. Even though the rates of the act of 1913 were considerably below those of the act of 1909, there was no appreciable difference in the amount imported until 1917, when total imports suddenly jumped to $1,146,766 from $498,949 in the preceding year.

COMPETITIVE CONDITIONS.

Japanese imports have practically monopolized the field.

Conditions in that country are particularly favorable to the manufacture of silk handkerchiefs, as habutai, the chief material used, is essentially a Japanese silk made only in small amounts elsewhere, and other silks used are produced equally well in Japan. The process of converting the cloth into handkerchiefs can as easily be done in Japan as in the United States, and probably at much less cost because of the cheaper labor. It is a machine operation so simple that superior American efficiency would hardly counterbalance lower wages, and the machines, while possibly not made in Japan, can be obtained here or in Europe. The unit values of the silk handkerchiefs imported from Japan are much below those from other countries. Japanese handkerchiefs are plain hemmed, hemstitched, or the very cheap grade of embroidered goods.

ɔe of any particular advantages of the American manu-robably the reason why this has remained a subsidiary ustry.

SILK RIBBONS.

SUMMARY.

ng the various branches of the silk industry, ribbons are third
ıe of output, broad silks being first and knit goods second.
ɔ sewing silk, it is the longest-established branch in this coun-
'he production of silk ribbons in 1919 equaled $66,053,000,
was over three and one-half times the production 20 years
In these figures are included a small amount of pile ribbons.
rson, N. J., is the principal center of silk ribbon manufacture
United States. The production of New Jersey and Pennsyl-
ɔombined amounted to over 80 per cent of the total in 1914,
ɔduction in other States declined from 1909 to 1914.
ral factors tend to concentrate the ribbon industry in particular
es. The first of these is nearness to labor skilled in silk weav-
'his is more essential than in the broad silk industry because
nand is more variable and production less certain, hence it is
ifficult to hold together the labor organization of a ribbon mill.
ɔuch mills are located in definite silk centers, the workers shift
ıd forth from one branch of the industry to another. A second
ɔration affecting the location of ribbon mills is that they are
small and not equipped to do their own throwing. There is
dvantage in being near the throwing plants, since transpor-
ınd insurance charges on silk are very high.
rican mills manufacture ribbons of standard quality and width.
ɔonstitute the bulk of the trade. Few fancy ribbons are made
ɔountry. Conditions of manufacture tend to preserve this line
vage between the domestic and the foreign product. The
automatic high-speed multiple-shuttle ribbon loom, producing
imum quantities, has been found well adapted to American
ls of manufacture.
gn manufacturers have equally effective machines, but the
ost of foreign labor makes possible a larger introduction of the
lement and permits a much broader field for variation in
and weave. Imports, therefore, consist mainly of novelty
or those elaborately figured, which can not be made profitably
ɔountry. Foreign manufacturers do not compete in this mar-
ordinary standard grades. France and Switzerland have
been the principal countries from which ribbons are imported.
ıy has contributed quantities of cheaper ribbons which make
ght part of the total value. For the 30-year period (1891–1920)
ıual average of silk ribbon imports was $1,382,247. This
very small ratio to domestic production in any census year.
s for 1919 were the lowest in the history of the industry while
ic production was the highest, hence a comparison in that year
ıot represent the true relation. Imports for 1914, however,
ɔing to $2,146,987, were much above the average and a remark-
ɔrease over the previous four years. In that year the value of
ɔons imported equaled 6 per cent of the value of the domestic
ɔ. Imports for 1921 were valued at $862,727.
American ribbons are exported each year, but normally
ɔ not represent a significant part of the world's trade. During
few years exports have been considerably larger than imports.

The American manufacturer holds the domestic market on all but fancy goods and novelties. Imports supplement the domestic product rather than compete with it. This will probably remain the case as long as conditions of manufacture here and abroad hold their present relation. Should European labor costs approach the American, the foreign manufacturer would undoubtedly turn to American high-speed, quantity-production methods, which are not unknown, but considered less desirable while it is possible to produce distinctive articles.

TABLE 4.—*Silk ribbons—Summary table.*

Year.	Domestic production.	Imports for consumption.	Amount of duty.	Ratio of imports to production.	Actual or equivalent ad valorem rate.
				Per cent.	*Per cent.*
1910	[1] $32,744,873.00	$934,429.15	$467,214.59	2.85	50.00
1911		687,984.00	343,992.00		50.00
1912		601,131.34	300,565.67		50.00
1913		596,896.00	298,448.00		50.00
1914	38,201,293.00	2,146,988.07	996,489.15	5.62	46.41
1915		583,187.00	262,434.15		45.00
1916		230,756.00	103,840.20		45.00
1917		197,533.00	88,889.85		45.00
1918		105,483.00	47,467.35		45.00
1919	66,186,609.00	74,778.00	33,650.00	.001	45.00
1920		526,255.00	236,814.75		45.00
1921		862,727.00	388,227.00		45.00

[1] Figures for 1909. Figures for domestic production include velvet and plush ribbons. Figures for imports do not. Velvet and plush ribbons, however, are but a small fraction of domestic ribbon production.

GENERAL INFORMATION.

DESCRIPTION.

Ribbons are narrow woven fabrics with fast edges. They are rarely woven in widths greater than 8 inches; goods over 12 inches are not considered ribbons and are not made on a ribbon loom. While imitation or "cut" ribbons are made by cutting into narrow strips a cloth, usually specially woven for the purpose, real ribbons are always woven separately, and thus have fast selvages. They are generally made wholly or in part of silk in many types, such as taffeta, gros grain, single and double faced satin, two-toned satin with a different color on each face, and fancy figured ribbons.

The measurement of the width of ribbon is explained as follows in an earlier report of the Tariff Commission:[2]

"Silk ribbon quotations are based on the ligne (of width) per bolt of 10 yards. The ligne is one-twelfth of the old French pouce (2.707 cm.), and is therefore equivalent to 0.0888 of an English inch. Ribbons are also numbered, from No. 1 (baby ribbon) up to No. 100 or over. This numbering system originally was based on the thickness of an old English penny, which was nearly the size of our silver dollar, but the system has been corrupted. Different manufacturers use the same numbers for different widths, and it has become the practice to use higher numbers on fine than on cheaper ribbons of the same width. Above No. 22, or 30 lignes, the number is now only an approximate indication of the real width, and is frequently little more than a fancy name."

[2] "Silk and manufactures of silk," Tariff Information Series No. 3, p. 28.

h 316 of the 1913 tariff act makes special provision for
it excepts the following: (1) Ribbons not wholly or in
of silk; (2) goods over 12 inches in width; and (3) rib-
have been embroidered. Velvet and plush ribbons are
ically provided for in the tariff paragraph dealing with
, and ribbons in chief value of metal threads, provided for
graph 150, are also removed from the application of para-
[3] The following discussion relates only to ribbons included
ph 316.

DOMESTIC PRODUCTION.

nce of the industry.—The ribbon industry ranks third
lk products. Broad silks are first and silk knit goods
The total value of silk products, including silk knit goods,
l to $923,873,000 in 1919. In 1914, the United States pro-
8,000,000 worth of silk ribbons, a little over one-fourth as
the value of the domestic production of broad woven silk
this was increased to over $66,000,000 in 1919, but the pro-
:o broad silks was less.
ials.—"All-silk" ribbons are generally woven from "thrown
yarn made by twisting together the strands of raw silk reeled
e cocoon. A cheaper silk yarn known as "spun silk" which
by dressing and spinning silk waste is sometimes used for
:" ribbons either alone or in connection with thrown silk.
:r made from thrown or spun silk, ribbons in chief value of
:y contain, in either warp or filling, cotton, artificial silk, or
extile fiber. The United States is the greatest thrown-silk
er in the world, adequately supplying the ribbon industry,
though European prices are probably slightly lower than those
ling in the United States, the difference is offset by the tariff
5 per cent), so that the imported silk affords no price advantage
consumer. The divergence between spun-silk prices on the
ontinents is of greater importance since the European price is
y less than the American by at least the full extent of the duty
per cent. Because of the duty, sizes up to and including 60/2
sh count in silk of ordinary grade are more profitably procured
: United States; finer sizes and special qualities, abroad. Arti-
silk is frequently used in connection with real silk. It is ordi-
r somewhat more costly here than in Europe, but the enormous
rapid development of this industry and the increasing uses of
iber have made the demand and supply so variable that prices
: fluctuated too materially to maintain a constant relation in
rent countries. A very large amount of the ribbons made in
silk mills is mixed-silk goods requiring considerable quantities
otton yarn, usually of fine size and high grade, gassed, combed,
mercerized. Domestic cotton yarns are generally used, but
ual imports from England for use in the manufacture of ribbons

[3] The special sorts of ribbons not within the application of par. 316 are provided for in the tariff as fol-
: Cotton ribbons, par. 262 (cotton small wares); velvet and plush ribbons, par. 314 (pile fabrics);
:" ribbons and goods over 12 inches, par. 318 (broad goods); embroidered ribbons, par. 358 (laces, em-
deries, and trimmings); ribbons in chief value of tinsel wire or metal threads, par. 150 (gold, silver,
ther metal tinsel wire, lame, bullions, threads and manufactures). Although certain ribbons are also
ned "trimmings," it has been held that if the goods are properly designated ribbons, they should be
sified as such regardless of whether they could also be properly designated as trimmings.

amount to about 50,000 pounds of a few special counts which are mainly combed and gassed mule-spun Egyptian cotton in the gray, though some of the lower counts are made of American cotton.[4]

The situation as to dyestuffs is uncertain, owning to the recent development of the American dyestuff industry. The American ribbon producer at present probably pays somewhat more than his European competitor for dyestuffs. The cost of dyestuffs, however, is a minor part of the total cost of silk ribbons.

Equipment.—The looms and auxiliary machinery required for the weaving of ribbons are extensively made in the United States.[5] Except for an occasional specialty, therefore, domestic ribbon weavers use domestic equipment exclusively.

Method of production.—The weaving of ribbons is somewhat different from that of broad silks inasmuch as the ribbon loom has so many different "spaces" in which separate ribbons are woven simultaneously. The narrow loom is not completely automatic, as the bobbins which carry the filling threads must be replenished by the operative. While the fly shuttle is used on the broad loom, the shuttles of a multiple ribbon loom are positively controlled. A reciprocating rack and series of pinions impart the movement coincidentally to all the shuttles across the width of the ribbon loom. These looms may be very varied in the details of construction, but for the most part they are plain, narrow, cam looms which may operate as many as 60 spaces at one time. With the invention of various automatic adjustments and other improvements in construction the tendency has been to build the looms longer and longer, but some manufacturers maintain that an operative can tend two shorter looms more advantageously than one long one. Of course, in districts where labor is well organized union rules will probably affect the kind of loom in use, especially as the unions are opposed to a worker operating more than one loom. Frequently there are two tiers of spaces to a loom, but this has been found by some not to produce the quality of goods obtainable on a loom with a single row of spaces.

There are two general types of the narrow or ribbon loom, the straight shuttle and the circular shuttle. These terms refer to the courses traveled during weaving, the straight shuttle moving from side to side over its appointed space in a straight line, while the circular shuttle moves in an arc. The advantage of this curved motion is that the track of one shuttle will cross the track of another during their movement through the shed, allowing the pieces of fabric to be more closely spaced than is possible on a straight shuttle loom. As more space per web woven is required on a straight shuttle loom the capacity is more limited, seldom exceeding 36 spaces, and the cost of production relatively greater. A single head loom which has been perfected in Switzerland is said to operate at a fabulously high speed, but its use is confined to very narrow fabrics, 1½ inches or under.[6]

---

[4] "Cotton yarn," Tariff Information Series No. 12, p. 92.

[5] In 1838 power ribbon looms were first designed and made in the United States, simultaneously with the introduction of the first power ribbon looms in Europe. The high-speed ribbon loom was invented in the United States in 1889. (Census 1900, Pt. III, p. 208.)

[6] The Textile Manufacturer (Manchester, England), Aug. 15, 1921, p. 239; also the Textile Recorder (Manchester, England), Aug. 15, 1921, p. 64.

ilk weaving, while the winding of the weft yarn on cops which
› the shuttles is a relatively simple machine process, the winding
warp and the fitting of the hundreds or thousands of warp threads
he attachments of the loom are complicated processes which
se of the fineness and fragility of the threads require trained
rs with dexterous hands. These processes can not be done
ıtomatic machinery; the few machines available assist the
tive rather than perform the work for him, each machine re-
ıg constant attention and direction. Once the warp is pre-
, the weaving is a rapid and relatively automatic process. The
of the operative is essentially to fill up exhausted bobbins and
omptly repair breakages which are indicated by an automatic
motion. In silk weaving the work is more difficult than in the
of cotton or other fiber weaving, because of the delicacy of the
and the usual compactness of the fabric, from 250 to 500 threads
ı inch being a normal silk warp. This large number of fine
ds leads to frequent breakages, which delay and make difficult
weaving of the fabric as well as the preliminary processes of
ing and warping. Practically every operation in the production
k ribbons requires comparatively skilled labor.

the manufacture of ribbons, the difficulty and slowness of the
: and the amount of highly skilled labor required for each unit
roduction are greatly increased by any of the following five
›rs:

) The use of especially fine silk, which makes breakages frequent.
) The use of low-grade silk, which also breaks frequently.
) The insertion of metal threads.
) The production of ribbons of complicated weaves, which makes
preparation of the warp slower and more exacting work, makes
ıkages in weaving more difficult to detect and to repair, and
ssitates the use of looms with Jacquard attachments, which
rate more slowly than other looms.[7]
) The weaving of small amounts of a single pattern. The
ller the amount made on a single pattern the greater the designing
; per yard; also the greater the per yard cost of preparing the
p for weaving.

abor.—Of the workers in a ribbon factory women are in the ma-
ty as the work is not heavy. It is too difficult, however, to make
employment of children profitable. Outside of the silk weaving
ters such as Paterson, N. J., the particular type of skilled labor
uired in almost every process of ribbon weaving is difficult to
ure and usually has to be trained.

n Europe ribbon workers are readily available. Previous to the
r, silk workers' wages were considerably less in Europe than in the
ited States, and even less in Japan than in Europe. The normal
rking day in Europe was about 10 hours, in the Orient over 12,
d in the United States 9 hours, sometimes with a half holiday on
turday. Working conditions, however, especially hours, have been
lically affected by the war and are still in a state of flux.

Because of this disadvantage in regard to skilled labor, the domestic
›bon weaver uses machinery, both in weaving and in preparatory
ocesses, more extensively than it is used abroad. In Europe

[7] Complicated weaves, also, can rarely be sold, except in small amounts.

there still remains a considerable amount of hand weaving. These differences affect to some extent the character of the output. The domestic manufacturer produces primarily those fabrics which have a relatively low labor cost compared with the total cost. Thus ribbons of standard weave produced on a large scale are the mainstay of the domestic industry. Silk of fine size is rarely used, but the thread is almost always of fine quality because the machines are run at higher speed and there are fewer breakages than if low-grade material were used.

Organization.—The ribbon industry is fully developed. It was the first branch of the silk industry, after the sewing thread industry, to secure a foothold in the United States. Its large growth began shortly after the Civil War, under the shelter of the high post-bellum tariffs, and was carried forward by the rapid development of ribbon machinery in the last decades of the past century. Its expansion has also been promoted by the development of the broad goods industry, which began in the last quarter of the century, for there have thus arisen wider markets for materials and equipment and for skilled labor.

The typical ribbon firm confines its operations to the preparation of the warp and weft and to the weaving of ribbons. Most ribbon producers have the raw silk thrown on commission, purchase spun silk or cotton yarn ready made, and have yarn or finished ribbons dyed on commission. Ribbon mill equipment is therefore restricted to the loom and its contributory machines, and the minimum capital investment required for efficient production is not large. As a result ribbon weaving firms are generally of medium size. A few large broad goods firms also produce ribbons. These firms generally "throw" their own raw silk, sometimes even spin their own spun silk yarn from silk waste, and do their own dyeing and finishing. A few ribbon concerns also do their own throwing and others have interests in throwing mills. The large number of small firms and the efficiency of ribbon production on a comparatively small scale make the possibility of the control of the industry by a few dominant concerns exceedingly remote.

Demand.—Silk goods, more than goods of any other textile, are subject to great changes of demand, both with the rise and fall of general prosperity and with changes in fashion. The demand for ribbons is even more variable than the demand for silk goods generally. When other silk goods are having a year of great popularity, ribbons may be so out of style that few ribbon looms are in operation.[8] It is typical of the industry that large numbers of looms are frequently idle. Broad-silk weavers can readily become ribbon weavers, and with changes in ribbon styles there is a considerable ebb and flow of workers between the ribbon industry and the broad goods industry. Because of this changing demand it is difficult for ribbon mills to keep a large labor force over a series of years. Proximity to a skilled labor market is therefore more essential for ribbons than for broad goods, and as a result the industry is more concentrated at Paterson than is the broad goods industry.

[8] Thus in 1915 ribbons were the one branch of the silk industry in which there was almost no demand. See section on ribbons in the annual report of the Silk Association of America, 1916.

lthough ribbons are thus more subject to changes in style than
d goods, they are more standardized. The bulk of domestic
luction consists of goods so standardized that the product is
ble of complete description in terms of a standard color, weave,
width.

ographical distribution.—Paterson, N. J., is the center of the
ibbon industry. In 1919 46 per cent of all domestic ribbons
produced in New Jersey, 35 per cent in Pennsylvania, and 15
ent in New York. The ratio of these three principal ribbon-
cing States remained about the same from the census of 1914
it of 1919, with a slight gain for New York. A comparison of
ous census years seemed to indicate that Pennsylvania, with
eaper coal and labor, was rapidly gaining upon New Jersey,
iat *is not* borne out by the latest figures. The proportion of
se in active ribbon looms, from 1909 to 1914, was 36 per cent
nsylvania as against 5 per cent in New Jersey. In 1919
was a general reduction of 20 per cent in active ribbon looms.
crease in New Jersey was 15 per cent and in Pennsylvania 17
it.

estic production and consumption.[9]—The United States pro-
in 1919 approximately $66,000,000 worth of silk ribbon, in-
; a small proportion of velvet and plush ribbons. From 1899
) the production of ribbons in each fifth (census) year was
',179, $21,890,604, $32,744,873, $38,201,293, and $66,186,609,[10]
ively. The total increase was 258 per cent. At each census
om 1899 to 1919, the number of active ribbon looms were 7,000,
0,000, 11,000, and 9,000, respectively, and the total increase for
od was 55 per cent. The increase in production is principally
increased prices and to increased productive capacity of
c ribbon looms through the higher speed of operation and
the greater number of ribbons woven on a single loom.[11]
these figures can safely be accepted as displaying a steady
id growth of the industry, they can not be taken as an exact
on of the rate of growth in each of the several five-year periods,
census figures indicate the value of production in each fifth
ly, and the wide variation in the production of ribbons
r to year caused by the variation in the domestic demand
he production of any one year an unreliable index of the
production for the five-year period in which it occurs. The
iation from year to year in the amount of imports, in addi-
he variation in the amount of domestic production, makes
rison of domestic production with domestic consumption
nsus years of little significance. Roughly, from 1899 to
ratio of domestic production to domestic consumption of
is, including velvet and plush ribbons, increased from 85
o 93 per cent. Imports in 1919 were too far below the aver-
istify such comparison. As the imports of velvet and
ons are about equal to the imports of other ribbons, while
stic production of velvet and plush is but a small fraction

cal tables, see p. 6, infra. Ribbon-production figures are given by the census for value
nd plush ribbons are always included in the census with other ribbons.
ires; all-silk ribbons to the value of $52,047,330 and silk mixed to the value of $14,139,279.
ve looms of constantly greater speed and size been made from year to year but owing to the
the double-tier loom and the curved-shuttle loom, looms of the same size have constantly
actly arranged so as to carry more ribbons.

of the domestic production of all ribbons, the ratio of the value of domestic production to domestic consumption of ribbons other than velvet and plush ribbons is considerably greater than the ratios given above.

Domestic exports.—The American silk-ribbon industry has gained a market Canada and Latin America, mainly because of quick deliveries to the retail trade or because the ribbons were not obtainable from Europe. A considerable increase in exports occurred during the war, largely owing to curtailment of European competition. Exports were not recorded prior to January, 1922. For the first quarter of 1922 they amounted in value to $175,488, which was 70 per cent more than imports for the same period.[12] In the absence of official American export statistics in previous years, Canadian import figures are a more or less reliable barometer of our export trade. These show imports of "ribbons of all kinds and materials," under "other silk products," valued at $646,424, $1,481,545, $1,595,053, and $868,270 as coming from the United States in the fiscal years ended March 31, 1918, 1919, 1920, and 1921, respectively. The drop in 1921 was a falling off in American trade and not a general decrease in Canadian imports, which were $3,882,360 as compared with $2,844,386 in the previous year. There was some rise in the values received from France and the United Kingdom, but the greatest competitor to American trade was Switzerland, whose 1921 trade with Canada amounted to $1,812,962, over three times that of 1920 and more than twice the imports from the United States in 1921. Imports into Canada from 1910 to 1914 showed a gradual yearly increase from both the United States and Switzerland, in the first case from $106,108 to $160,505 and in the second from $287,567 to $512,504. Ribbon manufacturers consider it improbable that a large export trade will be maintained, because this trade calls only for goods from low-grade silk, such as are not advantageously produced in the United States, and because the European manufacturer caters to the export trade, while the domestic manufacturer offers only such products as he is making for domestic consumption. The fact, however, that ribbons were exported even before the war suggests that the domestic producer is able to manufacture those ribbons most advantageously made in the United States at a cost not far distant from that of his European competitor. Domestic exports in the last few years have been considerably larger than imports.

FOREIGN PRODUCTION.

In Europe, the greater availability and lower wages of skilled labor have allowed the survival of hand production. The same causes also permit the manufacture of elaborate Jacquard designs—often metal-thread designs—in small quantities to a pattern. Silk ribbons are produced most extensively in France, Germany, and Switzerland. In each of these countries the production is largely concentrated in a single ribbon-producing center: St. Etienne in France, Crefeld in Germany, and Basel in Switzerland.

The output of the French ribbon industry, as indicated by export statistics, has increased considerably since 1913. In 1913 exports of silk and mixed-silk ribbons other than velvet amounted to about

[12] See *Addenda*, p. 58.

000,000,[13] and in 1920 to about $36,000,000.[14] The exportation of vet ribbons showed very little increase. According to report [15] the ench production for 1921 is below the average and the Swiss indus- is proving a strong competitor. Reviewing Swiss export sta- tics from 1885 to 1920,[16] the industry seems rather to have declined an expanded. Considering quantity, the year of greatest exports s 1888; since 1895 there has been a very marked decrease, only ghtly bettered during the first three war years. There was a cided slump in 1917–18. The next two years show a recovery ualing 1914 exports in quantity.

The manufacture of ribbons in Switzerland is not entirely a tory industry, some of the work being done in the weavers' homes hand looms. For this reason there is more variety of product, d more elaborate designs can be worked out in the weaving.

It is not advisable to compare the trade figures of one country th those of another, because quantities, if recorded, are in different its, and exchange has been too variable to convert values to a mmon basis.

IMPORTS.

Imports for consumption.—For the 30-year period, 1891 to 1920, e value of imports of silk ribbons averaged annually $1,382,247, th an average duty of $680.713. The average annual value for the st decade amounted to $1,531,203; for the second, to $2,040,439; id for the third, to $575,099. Because of fluctuations in demand, pendent upon changing fashions, imports from year to year show nilar variation, so that the amount imported in any one year is of tle significance. Between the fiscal years 1901 and 1903, to cite extreme instance, the annual import of ribbons increased from ,913,000 to $4,230,000, and dropped again to $1,673,000 in 1904, rise and fall in four years of over $2,000,000. For several years bor conditions in the Paterson silk industry had been very much sturbed, and doubtless a shortage of domestic production accounted, part, for increased imports. Between the fiscal years 1913 and 915 a similar sudden wave of importation occurred. In 1912 and 913 strikes had depleted the stocks of the domestic industry. In 913 ribbons came into fashion, especially the elaborate styles most ommonly imported. The rapidly rising demand reached an ab- ormal height in 1914, the annual report of the Silk Association of merica saying: "It is unlikely that ever in the history of the Ameri- an ribbon business have so many looms been operating as during he first nine months of 1914."

The fiscal year 1915 began July 1, 1913, when American ribbon ocks were low and when the vogue for narrow was beginning o manifest itself. Imports of narrow, which in the fiscal year 913 were $596,000, rose tenfold, to $2,146,000. In 1915 the emand for ribbons changed. Narrow production was reported o be the one branch of the silk industry in which there was lmost no demand. Prices fell to a low point. Influenced by he high demand of the first nine months of 1914, importers had

[13] From official French statistics, francs converted at par.
[14] From report of Consul C. Corrigan, Lyon, France, Mar. 29, 1921, converted at 14.50 francs to the dollar.
[15] The Textile Mercury, July 2, 1921, p. 24, and Commerce Reports, May 29, 1922, p. 565.
[16] Compte Rendu des Travaux de la Chambre de Commerce de Lyon, 1918; figures for 1919 and 1920 from wiss official trade reports.

placed large orders. As a result, in the fiscal year 1915, which included six months of the calendar year 1914, a much greater quantity was brought into the country than the market could absorb. Evidence of this appears in the excess of general imports (imports by countries) over imports for consumption which indicates that stocks were retained in bonded warehouses. The value so withheld from consumption, however, would not be as great as the differences in these figures would seem to indicate, as certain varieties of ribbons, notably those in chief value of metal threads and those ornamented with embroidery, would be included under general imports, but not under imports for consumption, where they would fall under general classifications of metal-thread and embroidered-silk articles, respectively. This is seen by a comparison over a series of years. From 1914 to 1920, inclusive, the totals given under general imports of silk ribbons have amounted to $6,464,733, whereas imports for consumption during the same years amounted to $3,866,979, a difference of $2,597,754. As so large a proportion of the amount consumed would hardly be allowed to accumulate in warehouses, and as reexports amount to practically nothing, some of this difference may be accounted for by ribbons of the two classes referred to above. Ribbons in chief value of metal threads are dutiable under paragraph 150 and embroidered ribbons under paragraph 358 of the act of 1913. Since 1915 imports for consumption have, despite increased prices, remained low in value. The highest was in 1921, when they were valued at $862,727. A comparison of the amount of the annual imports of ribbons with the condition of the domestic ribbon market, as reported in the annual reports of the Silk Association of America, indicates that in normal years, just as in these years of extraordinary demand, the rise and fall in the amount of imports accords closely with the rise and fall in the domestic demand. On the whole, however, although the domestic demand shows a tendency to rise, the value of imports displays a tendency to decrease.

Imports by countries.—In 1914, 59 per cent of all imports were supplied by France, 36 per cent by Switzerland, and 3 per cent by Germany; in 1920 the percentages were 78, 13, and 2.8, respectively; in 1921, 64 per cent came from France, 20 per cent from Switzerland, and 11 per cent from Germany. While the proportion of imports supplied by each of the several foreign countries in 1914 was roughly typical of the decade preceding the war, the portion of the imports supplied by France had shown a tendency to increase and those supplied by Germany to decrease. The greatly increased proportion received from Germany in 1921 is difficult to explain except on a basis of depreciated exchange. This theory is substantiated by the low unit value of the German goods, 6 cents per yard as compared with 11 cents for the French and 14 cents for the Swiss.[17]

Nature of imports.—Imports of silk ribbons are mainly of those required in quantities so small that domestic mills consider it unprofitable to make the frequent changes necessary to hold this

[17] In 1918 the proportion of the total imports supplied by Switzerland greatly declined. This drop was explained by the United States consul in Switzerland as being due to an artificial inflation of ribbon prices in Switzerland through an agreement of the merchants in Switzerland regulating prices of sales to England. Though they were willing to make special prices for sale to America, "market value" on which duty is computed was so inflated that the present ad valorem rate proved prohibitive. (Report of United States consul at Basel, June 10, 1918.)

They represent largely extreme novelties, including gold ther metallic effects, as well as the complicated multicolored ard designs. The importation of staple articles practically d years ago. Ribbons made in very small amounts, and s of very fancy weave, or with metallic threads, as has been usly explained, require unusually large amounts of hand by exceptionally skilled workmen, and are, therefore, not vely made in the United States. In years of abnormal l, such as 1903 and 1914, ribbon imports probably contain rable amounts of staple ribbons comparable with the usual domestic manufacture, imported only to supply a temporary e. Thus, imports of ribbons are, generally speaking, supple- y to domestic production, and do not compete with it.

TARIFF HISTORY.

ous to 1909, no specific provision for silk ribbons was made tariff. There was much litigation concerning the dutiable ation of silk ribbons, which in one line of cases involving unds to importers were held to come within the tariff desig- or trimmings, but later, under the act of 1897, they were l as manufactures of silk not specially provided for when mercially known as trimmings. In 1909 ribbons were lly provided for under about the same description as is he act of 1913, and made subject to a duty of 50 per cent. 13 they have paid a duty of 45 per cent. In the fiscal 4, the year in which the tariff act of 1913 went into effect, of ribbons, as has been previously explained, increased to several times that of the preceding year. However, sub- o the fiscal year 1914, imports have been exceptionally small, e first three months of the fiscal year 1914, when the former still in force and when it was known that the lower duty come operative in the last nine months of the year, more e imported and entered for consumption than had been im- d entered for consumption in the preceding year. Owing acts and to the sharp wave of extraordinary demand pre- 1913 and 1914, which has been previously discussed, the ort of 1914 can not be considered a result of the lower 913.

COMPETITIVE CONDITIONS.

estic producer faces no great competitive disadvantage in procuring machinery, or the cotton yarn and thrown silk most ribbons are made, but must pay more for the spun or ribbons of cheaper grades. As a whole, he suffers dvantage in procuring materials or equipment. The for the most part well standardized. The method of pro- ows extensive use of machinery and is well suited to domes- ons. The industry, however, requires comparatively r in almost every process, and the domestic producer has e disadvantage in the smaller supply and higher price of r in the United States as compared with Europe.

petitive position of the domestic and Euporean producer moreover, in regard to the production of different sorts

of ribbons. In producing ribbons of standard weave from high-grade materials, the competitive position of the domestic producer is strongest, for these ribbons permit of the most machine manipulation, involve the employment of the least highly skilled labor, and represent the lowest labor cost per unit of output. Such ribbons are extensively made in the United States and practically none are imported. Even before the war there were some exports of this type of goods.

The competitive position of the domestic producer is less strong in regard to the production of ribbons made from low-grade raw silk, even of standard weave, for the machinery can not be run at such high speed, and, as has been explained, the labor cost per unit of production is greatly increased when low-grade silk is used. Therefore it does not pay the domestic producer in the same proportion to manufacture ribbons from low-grade raw material.

Finally, in the production of ribbons demanded in small quantities, of ribbons of complicated weave, of ribbons made with tinsel or metal thread, and of ribbons made on hand looms, the competitive position of the domestic producer is weakest. The production of such ribbons requires not only an exceedingly large labor cost in proportion to total cost, but the employment of very highly skilled labor. They are not extensively produced in America, and the most extreme types could not be profitably produced here without a much higher degree of protection. They form almost the entire import, which is therefore not competitive with domestic production.

The ribbon industry is a branch of the silk industry which is of long standing and which is fully developed. The duties levied in recent years have prevented importation, except of the sorts of ribbons which domestic production is not well suited to handle, and of ribbons needed to supply a shortage of domestic production in years of swollen domestic demand. In normal years domestic production supplies the entire domestic consumption of ribbons advantageously made in America. The growth of the domestic industry is therefore mainly dependent upon the further growth of the domestic demand and the extension of the small export trade which has developed, rather than upon elimination of European competition.

TARIFF CONSIDERATIONS.

The variety of ribbons is so great, and the ribbon import so largely composed of specialties which can not be adequately covered by specific duties, unless those duties be based upon an unduly minute and technical classification, that specific duties on ribbons have generally been thought impracticable. Any specific duty would need to be reinforced by an ad valorem minimum rate clause to provide for articles with special factors of value which a specific duty could not take into account, and as few ribbons are imported except specialties, most of the import would consist of goods that would come within that clause. On this account, although the tariff act of 1909 imposed specific duties on most manufactures of silk, ribbons were made subject to an ad valorem duty.[18]

[18] In a communication to the Tariff Commission (May, 1919) one of the leading men in the silk industry said: "An ad valorem duty was placed on ribbons in the tariff of 1909 when almost all other duties were specific, because of the difficulty of preparing a specific classification which would take into account the varieties in the 'ligne' (width) of ribbons as well as the variations in quality, fineness, weave, and other characteristics. An ad valorem duty was also chosen because it was found difficult to get ribbon producers to come to an agreement as to what would be satisfactory."

SILK SMALL WARES.

SUMMARY.

manufacture of plain small wares, narrow fabrics under 12 in width, when braids are not considered, represents but a part of the silk industry. The conditions of manufacture are ied that it is impossible to separate it entirely from other es of silk production.
most important item imported is hatbands. Domestic produc- 1914 was $607,204 and imports amounted to $484,369. These rom Germany, and in normal times there was considerable com- n between the foreign and the domestic article. Only small ts of other narrow goods are imported. The greatest value was 80 in 1921. The articles included in this paragraph are mainly es suited to standardization and quantity production.

GENERAL INFORMATION.

DESCRIPTION.

term "small wares," while not used in the tariff act, is fre- ly applied to narrow fabrics not over 12 inches in width and scellaneous articles made immediately from the silk thread, as cords and tassels. Most narrow fabrics are woven on the n loom, but many of the products of the braiding machine are r in use and in general appearance. Some of these fall under emized provisions of paragraph 316 (act of 1913) as the most ic description; braids in general are dutiable at a higher rate · paragraph 358.
the articles included in paragraph 316, *banding* comprises the part of the imports. It is a narrow fabric, either woven or ed, used as hat and cap bands, as borders or finishing on dresses, or securing bundles of cigars. Elastic banding is frequently silk ed and as such would come under this paragraph. It is used for rs and in the manufacture of corsets and various kinds of sup- and braces. The market is largely supplied by the domestic try.
nding is used to secure the edges of cloth or of a garment to pre- fraying or raveling or to give additional strength. One of the familiar forms of binding is a thin taffeta ribbon, about three-

eighths of an inch wide, sold in bolts of from 8 to 10 yards each for seam finishing. This comes in all staple colors and is carried in quantities by retail stores, as well as being sold to the garment trade. A braidlike binding is frequently used as a finish for the edges of tailored garments, and there are special bindings for carpets and for blankets.

Belting for separate belts of narrow silk fabric is little used at the present time, but inner belting to which skirts, or the waists and skirts of dresses, are attached to insure the proper adjustment of fullness and "hang" is considered practically indispensable. Much of this is cotton, but silk belting in varying widths from 2 to 4 inches, either reinforced with boning or made of a heavy grosgrain, is manufactured in large quantities for use in garments of the better quality.

Bone casings are narrow tubular fabrics with which corset steels and "boning" used in dressmaking are covered.

Braces, suspenders, and garters are articles produced from narrow fabric, usually made elastic by weaving india-rubber threads in the warp. The manufacture of elastic banding, webbing, and articles made therefrom is a very important branch of the small-wares industry, but imports are slight. Former tariff acts had a special provision for gorings which were the elastic bandings used in the sides of shoes. The vogue for this style of shoe passed and the term gorings became practically obsolete.

Tubings, including tubular elastics, are fabrics woven or braided in tubular form.

Webbing is the term commonly applied to narrow fabrics, whether woven or braided, which are intended for strength or to bear weight, such as a belt or a surcingle or suspender webbing. Suspender webbing sometimes has the button-holes automatically woven into it.

Cords are made by braiding or by twisting together three or more threads; the larger the number of threads the more nearly does the cross section of the resulting cord approach a circle.

Tassels, frequently used as a finish for the ends of cords, are made by securing a bundle of threads or small cords at one end in such a way that it may be used for a pendent ornament.

Narrow fabrics embroidered in any manner are excluded from the provisions of paragraph 316 and fall under paragraph 358 of the act of 1913. Articles made by cutting or splitting goods woven on wide looms are dutiable under the provisions for broad silks.

DOMESTIC PRODUCTION.

Materials.—The United States is the greatest raw silk market in the world and has the largest silk throwing industry; hence silk yarn is as easily obtainable here as in other countries, and with little price variation. For some small wares cotton is used in conjunction with silk, and special purposes require yarns which are not normally made in the United States. Hatbands, which are one of the most important articles included under small wares, are usually made with a weft of cotton yarn. In a report on cotton yarn made by the Tariff Commission in 1920,[19] it is stated that whereas some hatbands are made entirely of silk, the staple article of large consumption is a mixed

[19] Tariff Information Series No. 12.

de with a silk warp and cotton filling. Domestic cotton
e not found suitable for hatband manufacture, and English
this purpose were imported in increasing proportions. Dur-
eriod of high prices, American spinners, having a greater
profit, were able to expend more effort to meet the require-
hatband manufacturers. Cotton yarn for use as filling in
must be combed or else extra well carded, preferably of long
tton, and spun and twisted (doubled) very evenly, so that
ven with a silk warp the product will be as free as possible
aps. Very little twist is given these yarns and they are
' or polished to lay the fuzz. English yarn has usually been
l in the gray, but some German-dyed yarn has been used be-
the superiority of the colors. Cotton yarn imported for use
anufacture of hatbands amounted to 180,178 pounds in 1914,
14,702 pounds in 1918.

ıch detail is available concerning other branches of the silk
ares industry, nor is the collection of such data warranted for
pose of this survey, as other items in this paragraph are not
to the same foreign competition.

ods of production—Equipment.—The articles enumerated in this
ıph are for the most part products of the ribbon loom[20] usually
aple weave, as they are intended more for purposes of utility
; trimmings, which are specially provided for under paragraph
ıttempts have been made to produce elastic webbing in wide
slashed to width by stationary knives in the loom, or by cal-
ıg a sheet of elastic between two pieces of finely woven cloth
tting into strips, but neither of these products met with much
Practically all elastic webbing is now woven with finished
ɔn narrow looms.

many is the most important manufacturer of textile machinery
ıall ware weaving and formerly narrow looms were imported
that country and from England, but domestic manufacturers
now developed a type of loom peculiarly adapted to manufac-
; conditions in the United States. In order to counter-balance
eater labor costs, speed of operation is a very important ele-
in American production. To this end narrow looms have been
which are often speeded as high as 180 picks per minute.
perate at this speed, with so many pieces of web, a heavy
of loom is required to make satisfactory goods, free from thick
thin places resulting from irregularities of speed or variable
ıentum.

ıe speed of the looms is not so significant a factor in the German
stry; hence it is feasible to operate much lighter machinery,
ramework of which is, as a rule, of wood and the looms in conse-
ıce much cheaper than the American. It is possible, therefore,
ı German factory to be equipped at less cost than an American,
, because of the smaller and slower looms, to produce a greater
ety of articles.

he labor unions are particularly well organized in branches of the
ll wares industry in certain localities in the United States and
trol the output per operative, allowing one person to run only one
ɔon loom or two garment-label looms.

---

[20] See Ribbons, p. 12.

Organization.—There is practically no uniformity in organization of the silk small wares industry; some articles, such as hatbands, are made in ribbon factories, in broad silk mills, or in establishments devoted solely to the manufacture of hatbands; some concerns make a great variety of articles, and as the machinery may be readily diverted from cotton to silk, both cotton and silk small wares are sometimes, though rarely, made in the same factory.

Geographical distribution.—There are no distinctive centers of this industry in the United States as there are in Europe, though a considerable proportion of the hatband production is in Paterson, N. J. In general the largest part of the output comes from New York, Pennsylvania, New Jersey, Massachusetts, and Connecticut.

Domestic production.—The production of articles embraced in paragraph 316 can not be reckoned with any degree of accuracy because the census classifications do not coincide with tariff descriptions. Under the designation "Braids and bindings," which comprise some of the articles included in the small wares paragraph, and probably in larger proportion some which are not, the census figures show a value of $3,073,648 in 1914, and $12,837,000[21] in 1919. The unclassified products made by the silk manufacturing industry proper reported under the general heading "All other" are shown in some detail for 1914. These include several items of small wares, labels valued at $971,789, hatbands at $607,204, and fishlines at $177,150. Suspenders, garters, and elastic webbing from which these are made are given as a separate industry with a total production of $24,432,753 in 1914 and $58,884,000 in 1919, but no distinction was made as to the materials of which the articles were composed. Massachusetts and New York led in value of output.

Exports.—No export statistics are recorded prior to January 1922; for the first quarter of 1922 they amounted in value to $43,317, which was greater than imports for the same period.[22]

FOREIGN PRODUCTION.

The countries of foreign production can only be judged from trade statistics, a general survey of which points to the fact that prior to the war, at least, Germany was the most important foreign manufacturer of silk small wares, supplying about 90 per cent of the imports into the United States. This trade was largely in hatbands, which industry thrives at Barmen, Elberfeld, Crefeld, and the surrounding district. An American manufacturer of hatbands, who also imported the German product, stated that the Germans had certain manufacturing advantages, for even with slower machines German labor costs were no greater than the American, whereas this very factor enabled them to save material costs by using a looser twist and lighter weight silk yarn than would be possible on the high-speed American machines.[23] A correspondingly greater labor cost would be involved on the part of the American manufacturer by any attempt to save materials through slackening production. The manufacturer quoted also stated that silk dyeing at that time was about as expensive but more satisfactory in Germany than in the United States. As small

tzerland figure to some extent in the export trade. St.
in France is especially known as a center of the hatband

IMPORTS.

ering the 30-year period, 1892–1920, during which four
tariff acts were in operation, the largest imports of silk
res amounted to $1,221,528 in 1907. Imports under the act
vere less than under the act of 1890, although the duty had
ıced from 50 to 45 per cent. The act of 1897 broadened the
tion so that the larger amounts shown during those years do
:ate that imports actually increased. There was in fact
.y a steady decline from 1907 to 1913 in which year imports
l to $489,830. As the largest part of these reduced impor-
ame from Germany they dwindled still more after 1914. A
rival of the German trade was apparent by a rise in the
:or 1920 and 1921. In the latter year they amounted to

large part of the imports, usually from 80 to 90 per cent, are
;s, including hatbands" that separate statistics for this item
ı recorded since 1903. The heaviest imports were $1,042,923
From 1910 to 1914 there was considerable decrease in the
imports due presumably to the growth of the domestic
The value of imports in 1913 was $458,065, the lowest
ear. In 1920 a value of $142,201 was imported and this was
in 1921 to $249,205, which was still far below the pre-war

1919 statistics of imports for consumption the item of small

SILK WEARING APPAREL.

SUMMARY.

ıring apparel of silk, except knit goods and wearing apparel ;ed in any of the ways specified in paragraph 358, is included ·aph 317 of the act of 1913. The manufacture of wearing s not divided according to materials, but rather according ıaracter of garment made. It is therefore connected with ıfacture of woolen, cotton, and linen goods. There are te figures as to the size of the industry, but it undoubtedly many millions. The size of the establishments varies from ernationally known houses to small shops working on a basis. All large cities are to some extent centers of garment ;ure, but by far the greatest part of the industry, particularly s carried on in New York. Exports of silk wearing apparel, ıre first recorded in 1918, have run from $2,556,166 in that ;10,016,045 in 1920. Because of general commercial condi- ports for 1921 were much less than for 1920, but, even with ease, exports for 1921 were over $1,500,000 greater than or the same year. Pre-war imports averaged somewhat less 000,000 annually. This decreased abruptly during war The recovery in 1920 and 1921 is the result partly of a in favor of more elaborate garments, but it is due chiefly to eign prices. Large quantities of French hand-made blouses, ır, and various other articles of clothing, were bought because ceedingly low prices in France. Japan is the second country tance in our import trade in wearing apparel. This repre- inite lines of Japanese goods, particularly kimonos. Men's apparel forms a small part of the total imports, but what

usually comes from the United Kingdom. The organization
ciency of the garment trade are such that the American manu-
rs are not apprehensive of foreign competition. They are
ent upon outside sources only for ideas as to the trend of
because of the acknowledged style ascendancy of Paris.

General Information.

DESCRIPTION.

ring apparel has been defined by the Supreme Court as "arti-
hich are ordinarily worn—dress in general." Ready-made
g is clothing made to stock as distinguished from clothing
o order. Paragraph 317 of the act of 1913 provides for all
aring apparel except that which is ornamented with lace or
dery. Wearing apparel composed of silk and india rubber is
y mentioned in the tariff act, but is dutiable at the same rate
r plain silk wearing apparel and statistics are not separately

wearing apparel represents a broad manufacturing field; in
embraces several separate and distinct industries, distinct
ne another according to the garment made, but inextricably
up with the manufacture of similar garments of other materials.
ample, manufacturers of dresses seldom make any other type
ring apparel, not even waists and blouses, which represent a
fined and well organized industry, or women's underwear,
has various subdivisions. Men's shirts are made by concerns
class, men's neckties by another, and usually men's under-
y another. Thus it will be seen that there are at least six
industries comprehended under the general caption "wearing
" and few establishments in any one of the six is devoted
vely to making silk garments. The average articles of dress
required in such large quantities that standardization with
sequent economies is possible in all these lines. Although
ifferent equipment is necessary for different branches of the
y, for example, skirts and dresses, specialization on one or the
evelops greater efficiency in the labor and involves less intri-
uying and selling organizations. The difficulty of securing
e statistical data in regard to silk wearing apparel is evident.
fficulty is heightened by the number of small concerns in each
y and by the impossibility of separating ornamented and
mented wearing apparel in the trade, although separately
d for in the tariff act. The information in this survey has
uently been based primarily upon interviews with men in the
vith trade associations, and representatives of trade journals,
h the examiners at the United States Appraisers' Stores at
t of New York.

s clothing, such as shirts and neckties, constitute a substantial
ion of plain silk wearing apparel, but certain lines of women's
ailored blouses and tailored underwear, which have had con-
le vogue, would also fall within this classification.

DOMESTIC PRODUCTION.

-The United States is the largest silk manufacturing
ıe world, especially producing quantities of the silks
ality which are used in ready-made clothing. The very
also made in this country, but probably at a somewhat
than would be required for similar silks in older silk
g countries. One manufacturer of the highest type
ɔthing states that, in general, American silks are superior

dress goods, practically all of which come from France
ɔvelties or special style features which do not represent
ɔle amount of the quantity used by the industry. They
acquard designs, or Jacquard designs made with metal
in metal thread cloth; in fact, practically all of the metal
used is imported, and the quantity would vary from
ıson according to the exigencies of fashion. A second
goods imported consists of plain woven goods in fancy
borate design produced in small quantities. A third
up of plain goods of fine quality woven of finer thread
ıpactly than the American and having a more lustrous

every weave of silk on the market is used by dress
rs, but materials accepted in other lines are more limited.
for underwear must be washable, hence crêpe de chine,
taffetas, such as radium and the trade-marked "Pussy
l wash satins are well adapted for this purpose. Shirts,
e of materials that will readily stand laundering; crêpe
en having colored stripes or stripes of satin weave, and
vhich is a shirting having a spun silk filling in taffeta
ɾe with a satin stripe, are two types of silk shirting pro-
e quantities by domestic weavers. Japan supplies a large
of the silks used for shirtings, particularly pongees,
fugi, any of which may be plain or striped. These, with
, have been imported in considerable quantities during
ɾears. Tie silks are a very distinct class, the better grades
n only small quantities of one design, the principal reason
which are fancies and novelties. In the tie industry,
ɾesent a larger proportion to the total consumed than in
tting-up industry. The best grades in conservative pat-
rom England, the more conspicuous designs from France,
grades from Italy. The English silks of exclusive design
ares about 28 inches by 28 inches, frequently only three
in one design and those in different colors. The French
made in squares, but are sold by the yard, a few yards of
a customer.
the silk wearing apparel industry is dependent upon for-
l, and most manufacturers profess a preference for Ameri-

t.—Little specialized equipment is necessary in the manu-
ɾearing apparel, the most important being the ordinary
ıine, or power sewing machine, with all its various modi-
l adaptations, and in large standardized establishments
cutter, besides button-sewing and button-holing ma-

chines, various machines for applying trimming, and mechanical devices for pressing, an essential operation in the industry. Equipment for the manufacture of wearing apparel of any kind, although representing a large outlay of capital for an establishment of much size, is not difficult to secure, all being made in this country. The sewing machine is an American invention and now highly perfected, manufactured by large, heavily capitalized concerns. Similar machines are also made abroad, but the quality of the American product is attested by the number exported. In the calendar year 1918 exports of sewing machines amounted to over $8,000,000, and in 1919 to over $12,500,000. Because of the large number of machines shipped abroad, some wearing apparel manufacturers, especially manufacturers of shirts, fear that this is indicative of a growth in the wearing apparel industry in other countries, which will jeopardize their interests in the American market.

Methods of production.—Conditions under which wearing apparel is made differ so widely that there is great variety in the methods of production. Some articles, such as shirts, neckties, underwear, and the cheaper grades of women's garments, lend themselves to quantity production and standardization, but in the more expensive lines only a few garments may be made according to one model, as the trade which can afford to pay higher prices demands exclusiveness.

Organization.—This difference in the character of the output leads to great variations in the organization of firms manufacturing wearing apparel. Where more or less standardization is possible, they are made on the factory system, but in many cases such goods are made in customs shops, and even by individuals. Practices vary widely within any given branch of the industry. In silk dresses, for example, there is the large manufacturer producing quantities of dresses according to few models each season. There are smaller houses, which make up fewer dresses in greater variety to sell to the retailer, and there are the very exclusive shops which make and retail the dresses in one establishment. Some large wholesale houses make the dresses in their own shops, some send out the materials and designs on contract, and some buy from small manufacturers. There is no hard and fast line between any of these classes of establishments. Similar differences exist in other branches of the wearing-apparel industry. Men's shirts and neckties, although made by large factories, are also made by shops, sometimes of the most exclusive sort. There is much variation in the size of establishments. Such comparatively simple machinery is required that the manufacture of wearing apparel is frequently started on a small scale.

As it is not the materials but the types of garments produced which represent lines of demarcation in the industry, no statistics concerning the silk wearing-apparel industry are available either from census reports or from trade associations. The character of ownership in the clothing industry in general is described in the census report of 1914, as follows: "Of the entire number of establishments reported for the industry in 1914, 42.9 per cent were under individual control, 16.8 per cent were operated by corporations, and 40.2 per cent were under 'all other' forms of ownership. This last group includes general and limited partnerships, cooperative associations, and any other form of ownership not classed as 'individuals' or 'corporations.'

s in this group reported 41.9 per cent of the average
ge earners and 44.4 per cent of the value of products.
entage of 'all other' is caused by such a condition in
e, which reported 68.9 per cent of the total number of
, 64.2 per cent of the total average number of wage
2.9 per cent of the total value of products, and natu-
he totals for the United States."[24]

distribution.—A large proportion of the industry is
r York, but all large cities are centers of silk wearing-
acture. Besides New York, Philadelphia, and Balti-
st, Chicago and Cleveland in the Middle West, and Los
West are important in this industry. New York is, of
st important market and has always enjoyed a certain
stige as the originator of styles in this country and as
oint of import of French models in women's wear and,
e, of English models in men's wear.

oduction and consumption.—No figures, or even esti-
estic production in the silk wearing-apparel industry
of the industry are available. Such data would be
if not impossible, to obtain, because, first, there are so
ops and establishments which in the aggregate con-
ge quota to the total production, and, second, silk
el is made by the same concerns that manufacture gar-
ool, cotton, or linen, so that a particular manufacturer
tly be unable to tell how much of one and how much
produced. It may safely be surmised that each of the
referred to produces goods valued at several million
lly. Silk dresses are worn in all parts of the country,
of women, and at all times of the year. The market
wear is more limited, but the use seems to become more
ear. Much of this is of course supplied by the manu-
lk knit underwear, but the very cheap grades are made
ight habutai and crêpe de chine and can undersell the
The very fine grades of underwear are also made from
These are usually elaborately trimmed with lace or
ence would fall under the classification of paragraph
sumption of silk shirts somewhat increased during the
wages, but year in and year out there is a definite and
this type of garment in certain localities. The extreme
outhwest makes woolen clothing unbearable during a
the year. This has led to the custom of dispensing
consequently the silk shirt of rather good quality finds
market in that part of the country. The fact that the
is by far the largest producer of broad silks indicates
wearing-apparel industry in this country, which would
t of the broad silks, is much larger than in any foreign

ports.—Export statistics of silk wearing apparel were
in 1918, in which year they amounted to $2,556,166;
reased by over 100 per cent in 1919 to $5,600,035 and
0 per cent in 1920, when they were $10,016,045. In
equaled $7,261,798. The large number of countries

[24] actures, 1914, vol. 11, p. 188.

which receive substantial amounts shows that this trade is widely distributed. These statistics include silk knit goods, and it is probable that a considerable proportion represents silk hosiery.[25] During each of the years for which statistics are given, exports to Canada far exceed those to any other country. Canadian import figures show that about one-third of the silk wearing apparel received from the United States consists of hosiery. Since Canada is the most important foreign market for American-made silk wearing apparel, a brief analysis of Canadian import statistics would be of interest. The total was $1,491,751 in 1918, of which 82 per cent came from the United States; $3,233,855 in 1920, 83 per cent from the United States, and $2,219,108 in 1921, 67 per cent from the United States. The classifications which make this total are hosiery, blouses, shirts, underwear, shawls, and clothing n. o. p. f., stated in order of importance except for the last, which is by far the greatest, amounting to over $2,000,000 in 1920 and over $1,600,000 in 1921. The United States supplied more than 78 per cent of the unspecified silk clothing and more than 90 per cent of both the hosiery and blouses in 1920, but only 61 per cent of the unspecified clothing and 83 per cent of the blouses in 1921. The per cent of hosiery varied little. Silk shirts are the only important item of which the largest proportion does not come from the United States. These are principally supplied by Japan, but the total is so small as not to affect the position of the United States in the Canadian silk wearing apparel market.

The United Kingdom ranked next to Canada as a consumer of American silk apparel in 1919 and 1920, in the latter year taking a value of $1,894,526. The value sent to Argentina in 1921 amounted to $1,028,976.

Cuba and Australia followed in importance, but exports to none of these equaled $1,000,000. The United States sent silk wearing apparel, valued at $411,181, to France in 1920, but this was less than one-sixth the amount received from that country in the same year.

FOREIGN PRODUCTION.

Although no statistics of production in foreign countries are available, there are many indications that France is first in this industry. An examination of imports into other countries usually discloses the fact that France is the chief country of origin. Few articles of wearing apparel are itemized in the statistics of many countries, but cravats are specified in the reports of most South American countries, amounting usually to a fair proportion of the total imports of silk wearing apparel in those countries. This may be because women's ready-made garments are less popular than in the United States. France, Germany, Italy, Great Britain, and Austria-Hungary are the principal countries from which silk cravats are obtained by South American countries. France supplies by far the larger part of other articles of silk wearing apparel imported into South American countries. The total exports of silk wearing apparel from Japan are rather large, but consist almost entirely of special articles, kimonas and nightgowns, as the Japanese can not make occidental clothing which in style and cut can compete in the markets of Europe and America.

[25] Export statistics for the first quarter, 1922, are given in more detail. See *Addenda*, p. 58.

IMPORTS.

r consumption of plain silk wearing apparel were not
tely from those ornamented with lace and embroidery
e act of 1913, so a table of total imports of silk wearing
1891 to 1921 is given, followed by a second table of
ain silk wearing apparel from 1914 to 1921. The highest
$5,275,668 in 1911 and the lowest $1,310,700 in 1899.
921 were $5,225,009, second only to 1911. The period
) 1911 was marked by a gradual increase in imports,
diminished in 1912 and 1913. The total imports for
ger than for either of the two preceding years, but it is
) note that over 40 per cent of the year's total came in
rst quarter under the higher tariff of 1909, the duties
.05 per cent, while the duties for the last three quarters
r 56.23 per cent of the valuation. During the remaining
the act of 1913 the annual value of imports was less than
ears under the act of 1909. This was probably due to
conditions of transportation, restriction of export, and
of luxury manufacture in belligerent countries. Silk
separately stated in import for consumption statistics.
greatest imports was 1913, for which 1,304 dozen, valued
are recorded. Since then the largest amount was 271
d at $10,815, in 1917.

s always been the most important source of the imports
g apparel into the American market, averaging $2,647,798
ears 1910–1914, over 50 per cent of the total. Although
decrease in imports from France during war years, the
$982,639 in 1918, and imports for 1921 were $2,749,610.

ier than France during the period shown in the table.
ta for 1921 was not so large. Japanese imports did not
ice of the diminished European supply, because they are
apanese products, consisting largely of kimonas and night-
e increase represents rather an increased activity of
anufacturers and a more energetic sales campaign in the
arket than a supplanting of other trade.

erviews with examiners at the appraisers' stores in New
and with men in the trade, it has been ascertained that
part of the silk wearing apparel imported is women's
parel, most of which comes from France. Paris is the
ter for women's styles, and costumers and manufacturers
untries go there for inspiration. Paris gowns are bought
e suggestions they carry; they are imported, for the most
y as models to be copied with various modifications and
expectation of being sold in this country at a price which

would cover the cost plus the duty, being considered an overhead expense. Under section IV, paragraph J, subsection 4, of the tariff act of 1913 articles of women's wearing apparel, for use as models only, may be imported in bond without payment of duty if reexported within six months. These gowns are frequently sold in Canada at reduced prices to avoid the necessity of paying duty in the United States. This provision is considered by the industry to be more important to success than a protective tariff would be.* Imports of women's wearing apparel, for the most part are not competitive with domestic production, but are necessary to stimulate the industry in this country, as Paris is the acknowledged leader in styles. There has been some increase in the imports of French handmade blouses which are offered for sale. This has been described as a temporary condition resulting from present relative prices as ordinarily it would not be profitable to import them in any quantities. Apparel ornamented with beading is not provided for in paragraph 358; hence would be imported under paragraph 317 at 50 per cent ad valorem. The amount of such goods that comes in depends entirely upon style. In the last few years it has been popular and some of the imports of waists and dresses entered for consumption and therefore offered for sale, have been those ornamented with beads.

There is no provision for the temporary free importation of men's wearing apparel, nor would such a provision have any significance, especially in silk clothing which comprises chiefly shirts and neckties wherein there would be little need for model garments. The importation of men's goods, determined to a large extent by quality, is on a small scale by haberdasheries and by individuals especially meeting the excellent material and superior make of French and English shirts. The Japanese have sought to develop this trade but although they use the best of silks the cut and make of their garments is as yet too poor to find favor where price is not the controlling factor. High-grade ties as other lines of men's wear including pajamas and underwear come from England and are more nearly competitive in character with the American product than are other lines of wearing apparel, but in actual imports the quantity is so small as not to affect the domestic industry to any extent.

To sum up, in general, imports of silk wearing apparel do not offer any real competition to the domestic industry in the home market. Increased imports have in large measure been caused by the present rate of prices. Women's wearing apparel is brought in chiefly by the manufacturers themselves to be used for models and not for sales purposes; men's wearing apparel, usually distinguished for quality or workmanship, is imported by shops which carry specialties or by individuals.

TARIFF HISTORY

The tariff rate on silk wearing apparel has always been a high one, varying only from 50 to 60 per cent under different acts. It was 60 per cent under the act of 1890, 50 per cent under the act of 1894 and again 60 per cent under the act of 1897. These rates

* American manufacturers state that because of American workmanship and efficiency of organization foreign goods are not normally competitive in [illegible] of the trade considers on a very small and American manufacturers must follow the fashion dictate of Paris. COURT AND TREASURY DECISIONS.

There has been much litigation upon goods in part of silk under paragraph 317 in competition with paragraphs not in the silk schedule of the act of 1913, principally paragraphs 358 and 333. Two cases not involving silk as a component material have been generally followed. They are United States *v.* Snow's United States Sample Express Company (6 Ct. Cust. Appls. 120) and Loewenthal *v.* United States (6 Ct. Cust. Appls. 209). The merchandise in issue in the Snow case consisted of shirt bosoms composed of cotton or flax, ornamented with loom-woven tucks, tuckings chief value. The provision in paragraph 256 of the cotton schedule for "wearing apparel * * * composed of cotton or other vegetable fiber, or of which cotton or other vegetable fiber is the component material of chief value, * * * made up or manufactured wholly or in part," was held more precisely and specifically to describe the merchandise than the provision in paragraph 358 for "tuckings, * * * and articles made in whole or in part of any of the foregoing fabrics or articles; * * * of whatever yarns, threads, or filaments composed." The required attributes of wearing apparel were declared to most closely describe and identify the goods which were held dutiable under paragraph 256.

The merchandise in the Loewenthal case consisted of tunics composed of lace nets, beaded, and motifs, garnitures, and gimps of beads with net foundation, the beads forming various designs, the entire article being ready to be applied to garments, together with running lengths or strips of such beaded designs likewise on net foundation ready to be applied to garments. The provisions in competition were paragraph 333, relating to beads and spangles and other articles not appliquéd, but composed in chief value of beads, and paragraph 358, which includes, among other articles, ornaments and trimmings.

The articles were held not to be appliquéd in the tariff sense because not ornamented with a pattern or design independently fabri-

g in chief value of beads, were held to come within

SILK KNIT WEARING APPAREL.

SUMMARY.

ous advances have been made by the silk industry as a
ore than twice as much raw silk having been consumed in
ı 1911. Imports of raw silk in 1911 amounted to 22,372,248
valued at $72,708,253, and in 1920 to 47,182,837 pounds,
t $437,954,994. The expansion in knit-goods manufacture
ı absorbed a considerable proportion of this difference, and

of the various branches of the silk industry it was probably one of the least affected by the slump of 1920–21.[27]

As a silk product knit goods are second only to broad silks. The total value of silk knit goods (including fabric) produced in 1919 amounted to $204,026,827, an increase of 393 per cent over 1914. Various items constituted this total in the following proportions: Hosiery, 62.80 per cent; outerwear (fancy knit goods) and gloves, 27.25 per cent; underwear, 6.74 per cent; fabric, 3.15 per cent; and thread, yarn, etc., 0.06 per cent. From 1909 to 1914 hosiery showed the greatest increase of any product of the silk knit-goods industry, the quantity according to the 1914 census being twenty times what it had been five years before. Although hosiery is still the principal kind of silk knit goods, from 1914 to 1919 the growth of outerwear production was the largest. At the same time the manufacture of silk underwear has been stimulated by a quickened interest in glove silk garments.

Imports form an inconsequential and diminishing part of the total consumption, the average for the 30 years, 1891 to 1920, being only $412,575, about one five-hundredth part of the production in the last census year. The proportion of imports to domestic production was tending to decrease prior to the war. In 1910 imports equaled 10 per cent of production and in 1914 less than one-half of 1 per cent.

Exports are now very much larger than imports. There are no official figures, but the value of silk hosiery sent to Canada alone is many times the total silk knit goods imported into the United States from all countries. The American market, however, is probably the best in the world for this class of merchandise and absorbs the principal part of the domestic output. There has been no foreign competition in the past, but such a large proportion of this industry has developed during the last few years because of enormously increased demand (not like some industries, because the war proved a barrier to foreign trade) that other countries have in all probability enlarged their facilities for making silk knit goods or will soon do so in order to share in a trade which is proving so promising.

[27] The commission throughout says: "Those mills equipped to handle only plain organizine and tram, such as used in yarn dyed manufactures, have had poor business, but those handling crêpe and hosiery tram report a good year. (*Mid-year report* of the Silk Association of America, 1920–21.)

General Information.

DESCRIPTION.

al classes of silk knit goods are hosiery, underwear, rs, and neckties, and ready-made clothing of such rsey. Silk hosiery, like cotton hosiery, may be seam-shioned, or cut from the fabric.

DOMESTIC PRODUCTION.

States is probably the largest producer of silk knit orld, because of the enormous quantities of silk hosiery sumed in this country.

–Raw silk of 13/15 denier size doubled and twisted into d tram or hosiery yarn, of 2½ to 5 turns twist per inch, osiery much more extensively than spun silk which, s inferior strength and elasticity, is less satisfactory for ough frequently used in seaming. A two-thread tram er twist, as much as eight turns to the inch, is knitted from which gloves and light-weight underwear are cut. are made from low grade raw silk of 10 to 15 ends united wist. The high cost of raw silk has somewhat lessened for these articles.

ng industry is now second only to the broad-silk industry er of raw silk. The manufacture of hosiery is the most ranch, followed by outerwear, gloves, and underwear. 00,162 pounds of raw silk and 1,913,478 pounds of thrown-n-silk yarn, and in 1919, 1,265,508 and 5,711,110 pounds, , were used in the making of hosiery and other knit s amount was not entirely devoted to the production of les as quantities of knit goods are made of mixtures of ol or silk and cotton. Although a large proportion of l in knitting is bought in the raw, the throwing (process of n by twisting, or doubling and twisting, the strands of s seldom done in the knitting mills. The knit-goods ers who purchase raw silk, with the exception of one or concerns, have it thrown on contract by commission most of whom are located in Pennsylvania. It is evident bove figures that the tendency is toward the purchase of k in increased proportions.

nt.—Knitting machines on which silk is used are not different from those using cotton. In the hosiery industry part of the silks are made on full fashion machines.[29] These of the Cotton patent type, though originally the product invention, were developed by German manufacturers and ry was practically dependent upon this source prior to the w, however, they are being built in the United States, but t has been limited and the full fashioned hosiery industry xpand as greatly as it would have if machines had been The machinery for manufacturing knit fabric has been ed that fabrics produced on knitting machines may possess y all the desirable characteristics of woven goods, with the

[29] "Cotton hosiery."

advantage of cheaper production, because hose can be produced four or five times as quickly and therefore labor and overhead items are smaller per unit. Some hoses, such as jersey cloth, are made on circular machines with either latch or spring beam needles. The most recent development of hose knitting and that now likely to gain in importance, is the warp-knitting machine of which there are many varieties. These are flat spring needle machines of very fine gauge producing a fabric of extraordinarily even texture. Milanese and tricot, the best-known warp knitting machines are imported from England and Germany or in some instances built in the knit goods factory.

Methods of production.—Silk hosiery is the most important item of the silk knit-goods industry. The same processes described in the manufacture of cotton hosiery are also used in the production of silk goods. There are three distinct types of hosiery according to the process of manufacture, the full-fashioned, the seamless or mock seamed, and that cut from the knit fabric. In the first two, form is given to the stocking in knitting; in the third, the knitting simply produces a fabric from which the stocking is to be made.

Full-fashioned hosiery requires greater skill in the knitting than does seamless and there are more processes. In making a full-fashioned stocking the leg is knit on one machine and then transferred to another for the completion of the foot. This gives a flat, shaped piece of material which must be seamed down the back of the leg and along the sole of the foot and "looped" or closed across the toe. Looping is a special process done on a machine which catches together only a single loop at a time from each of the pieces, making a very flat joint. The heel is also looped. This is known as the French system and is used in America. The English method requires only one machine. The sole is knit as a continuation of the upper part of the foot, then looped back at the toe and seamed along either side of the foot, but with no seam at the toe. The stocking is completed by a seam down the leg. There is no transferring in this process but the seaming is more complex.

Seamless hosiery is made on circular machines which are so nearly automatic that the completion of the hose after removal from the machine involves only the looping of the toe. A seam, though not necessary to this type of hosiery is frequently added to make it resemble the full-fashioned article. In some cases what appears to be a seam is only an imitation formed during the knitting process. Socks or ribbed stockings, even when seamless are made on two machines. The ribbing is done on one and then the article is transferred to another which knits the main portion.

The third kind of hose is cut from fabric as any other garment would be. This is a much more important branch of the silk hosiery industry than it is of the cotton hosiery industry. Only high-grade and expensive silk hosiery are cut from silk fabric while the reverse is true of cotton. Hose cut from silk fabric have less elasticity than those knit on a regular web knitting machine, but can be made of finer stock and in variations of patterns which are not so easily introduced on a hosiery machine. The fabrics used for stockings, gloves and underwear are made on warp knitting machines of the tricot and milanese types. They are so fine that it is difficult to determine the

a knit, hence they are frequently spoken of as tricot
weave," though more generally used terms applicable
glove silk" or "Italian silk." In the tricot machine
und on a beam and is directed to the needles by small
each thread on the machine; by means of a racking
eads are carried alternately left and right so that the
read are interlocked with those of the adjacent thread.
abric can be developed in open work and fancy stitches
n of needles or variation in the racking. The milanese
on a machine for which the warp threads are supplied
mounted side by side in such a manner that they form
rain revolving in an oval circuit. This allows two sets
e from either side of the oval, to be fed into the machine
the needles operating first upon the threads from the
ie oval, and then upon those from the far side of the oval.
s are moving laterally, each gradually replacing the one
he threads on the near side of the oval, or lower set of
y approach the needles, ultimately become the upper set
he threads in the lower course move from left to right and
pper course from right to left. Any given thread is thus
tep by step, tracing a diagonal course through the fabric,
ection and then in another. The finished fabric, upon close
will show the crossing and recrossing of these threads.
asily distinguished because of the looped nature of the
makes it difficult to follow any one thread with the eye
difference as a slight thickness of the yarn makes it stand
ece. This construction of the fabric makes it impossible

ondingly less elastic, and less suitable for hose or close-
garments. It is so soft and pliable that garments cut
ess bulky than those of woven fabric.

and the milanese fabrics are made 60 inches and more
Stockings and gloves are cut from the fabric by steel dies.
arranged that all parts of an article and as many articles
folds of material inserted under the die are cut at one
gloves and stockings are then seamed on power sewing
One operation which differs from the usual sewing process
orcement of the glove tips and stocking heels. An extra
is added in such a manner that except where it falls into
appears to be attached to the other material by the finest
g. This is done on a machine equipped with a horizontal
two thicknesses of material pass vertically beneath the
ght angles to it, being folded over at the line on which the
o be done. The spacing is so arranged that the needle
t a minimum of the material, making the stitches almost
ble on the right side. The gloves require, besides seaming,
ment of the facing around the opening and the insertion
eners, which is done by a machine. After the sewing and
ing-up processes are completed, the stockings and gloves
ed on forms and steamed. In some factories where goods
iest class are made this is done by hand, each article
on a form being held over a jet of live steam. This is a slow
nd more expensive than the use of patent forms, but it is

med to be superior for silk because of the higher luster imparted he fiber. Hosiery cut from silk-knit fabric is usually made of ot-weave material, as it is more elastic than the milanese, though so than weft-knit fabric. Moreover, the tricot can be developed variety of patterns, particularly open-work stripes, which at times very popular for women's hose. Gloves are more frequently made he milanese material. Women's underwear made of knit-silk ric may be cut from either the tricot or the milanese. This re- es more labor than hosiery or gloves, usually one garment at a time ut with hand shears according to a well-marked pattern, and the shed garments are pressed singly by hand. Glove-silk underwear enerally made up in tailored designs. Because of the similarity rocesses in the manufacture of cut silk hosiery, gloves, and under- r, the three are frequently made by one concern.

Warp-loom fabric in various textures may be used for any cut goods. ause of the parallel position of the yarns, this variety of knitting specially adapted to longitudinal stripes and is frequently em- yed in the construction of scarfs. Sweaters are either full-fash- ed, i. e., shaped on the knitting machines, or cut from knitted fabric. y are usually made on flat knitting machines of the weft type, metimes with Jacquard attachments, which produce elaborate pat- ns. Some of these flat machines have automatic narrowing de- s, which must be "set" for each narrowing operation, but fre- ntly they are only semiautomatic, much handwork being required he narrowing. A new line of manufacture which is gaining some portance is that of knitted dresses. Dresses cut from knitted fabric n as jersey, whether wool, silk, or artificial silk, have been on the rket for many years, but a comparatively recent idea is the full- ioned dress made of knitted parts shaped especially for the pur- e. Most frequently these are developed in all-wool or in a com- ation of silk and wool, but there is at least the possibility of the ilk fashion-knitted dress.

rganization.—There are four more or less distinct branches of silk knit goods industry according to articles produced, but ording to materials used they are frequently not differentiated n cotton and wool. These are full-fashioned hosiery, seamless iery, glove silk (which is essentially a silk industry), and outer r. Full-fashioned hosiery is usually made in large, well-equipped, heavily capitalized establishments. This is because one full- ion machine costs several thousand dollars and two such machines required for the completion of the knitting operation besides small chines, such as loopers and sewing machines. The initial expense quipping a full-fashioned hosiery mill is very large, and running enses are so heavy that small-scale production is not feasible. mless hosiery requires less outlay of capital, so that the size of n mills varies from a few machines to several thousand. Fre- ntly one large company will own many mills scattered over a siderable area to utilize labor in small towns where power is ly available. This is particularly the case in Tennesssee and other thern States where the abundance of water power has been con- ed into electrical energy easily transmitted long distances. As fine gauges of full-fashioned and of circular machines may be used making cotton or silk, a mill does not necessarily specialize on one he exclusion of the other, frequently making both in different

ording to the demand of the season, the price of raw
er variable factors. Glove silk, on the other hand,
mes which are not well adapted to the use of cotton,
are very costly and require high-priced workers to
ence practically all of the glove-silk production is by
large corporations; in fact, the largest knit-goods
United States, capitalized at $15,000,000, is primarily
of glove-silk garments. Sweaters, ties, and novelties,
ass of goods known as knit outer wear, are more often
mall concerns operating 10 to 20 machines, and using
silk. Such products are less standardized than hos-
d underwear and frequently require more handwork
ation of the machines.

distribution.—The leading States, in order of quantity
rding to the census of 1919, are: Pennsylvania, Mas-
Jersey, Wisconsin, and New York for hosiery; and
Massachusetts for underwear. Most of the concerns
ter wear and neckties are in Brooklyn, New York City,
nia. The greatest number of full-fashioned hosiery
lk hosiery are in Philadelphia.

duction and consumption.—The growth of the silk knit
, according to the quintennial census reports, has been
ensational. The total product amounted to $977,915
3,708 in 1909, $41,384,530 in 1914, and $204,026,827
igures include knit fabrics for 1914 valued at $2,738,932
t $6,437,000. The increased activity was particularly
outer-wear industry included under the census classi-
y knit goods [36] and sweaters," which attained a mag-
$40,000,000 in 1919, as compared with [37] $303,510 in
enomenal growth of this branch of the industry is not
decreased imports, for these have never equaled in a
age of one month's domestic production, but of the
popular favor for sports clothes. Year by year the
ater is extended. Once considered by fashion a utility
ports only, it has gradually assumed a more varied
oman's wardrobe and has evolved into a decorative
ng worn frequently for the color note that can thus be
o a costume. This has resulted in the desirability of
ny such garments instead of one. Scarfs of stripes
rs, so popular during the last few years, have become
ndard and accepted articles of apparel as the sweater.

Stores at the port of New York it seems that hosiery and outerwear constitute the larger part of the silk knit goods imported. The amount of underwear imported is very small and usually the ribbed type of garment. As the American silk gloves are considered superior to the foreign, very few are brought into the country, and as yet practically no silk fabrics in the piece have been imported.

The hosiery imported during the past few years has been almost entirely from France, with occasional shipments from England. These French stockings are almost without exception very fine goods, usually 44 gauge (44 needles to the inch), little if any of which is made in this country. Of late some German goods have been arriving; these are similar to the French in quality but are invoiced at considerably lower prices.

Openwork or lacework on hosiery and other knit garments is a favorite form of ornamentation. The production of this work involves considerable modification in the machine and a greater labor element, hence it is not particularly adapted to the American industry. This phase has received special attention in Chemnitz and quantities of hosiery, cotton and silk, having lace designs in the instep have been imported for sale during the summer of 1921. These are dutiable as lace articles and the values imported would not appear in the statistics for silk knit goods. The American openwork hosiery consists of that cut from striped openwork tricot fabric, but elaborate lace designs are practically all made in Germany or France, the cheaper grades probably in Germany. Some very high priced French hosiery has insets of handmade lace. Outerwear consists chiefly of sweaters and scarfs from Switzerland and England. This branch of the industry has made enormous strides in this country during the last few years, and although the increase in domestic production did not replace imports, or rather far exceeded any difference in imports, there is a strong probability that imports will tend to increase somewhat with the stabilization of industry in the countries equipped for this line of manufacture for the same reasons that the domestic industry has increased many fold. The development of the silk knit goods industry is the result of greater demand and not of any war time shortage of foreign goods.

For the 30-year period, 1891–1920, the value of silk knit goods imported averaged annually $412,575 with an average duty of $241,690. Imports for 1921 were far below this average, amounting to only $164,017. Notwithstanding an unchanged rate of duty from from 1898 to 1913, the amount of foreign goods received was rather variable from year to year, ranging from $200,800 to $750,000, except in 1907, when imports were valued at $1,472,157, about twice as much as in any year during the previous decade or in any year since. In 1913 the rate was reduced to 50 per cent, but imports have since been negligible as they normally came from the countries which have been disturbed by war conditions.

PRICES.

The War Industries Board study of silk prices (Table 23, p. 57) gives average annual prices on five grades of silk hosiery for 1913–1918, but the descriptions are not sufficiently detailed to identify the classes for comparison during succeeding years. However,

< hose, standard quality, which according to this
ed $22.125 per dozen pairs in 1918, were quoted
ometimes more in 1919. Silk hosiery, as was to be
ause buying of luxuries would soonest be curtailed in
ssion, and because of the break in the raw-silk market,
grade of hosiery to decline sharply. The Knit Goods

'oods Bulletin [36] states that 10-thread silk half hose were
$4.50 to $5 in October, 1921, while in October, 1920, the
price had been $6. On the other hand, tram-silk boot
ncreased somewhat in price during the same period. A
20-inch boot which sold for $7.25 in October, 1920, brought
3.50 a year later.

TARIFF HISTORY.

ff history of silk knit goods does not present much diversi-
ie rate changing only from 60 per cent in the acts of 1890,
1909 to 50 per cent in the acts of 1894 and 1913. The
ad apparently little effect upon imports which, while never
ied considerably, but not in relation to tariff fluctuations,
rather the general trend of business conditions. Imports,
utiable at only 50 per cent, were smaller in every year
: act of 1894 than in any year under the act of 1891, when
iad been 60 per cent. In the 16-year period during which
of 1897 and 1909 provided a rate of 60 per cent, imports
rom $199,919 in 1900 to $1,472,157 in 1907. The low
ior 1900 reflect a business depression in that year which was
by a rising period, culminating in 1906 and 1907. Following
ncial panic in the fall of 1907, purchases from abroad declined
, although it was not until 1909 that the full effect of the
it depression was apparent. After a slight rally in 1910
: declined considerably during the succeeding years, and in
ie last year under the act of 1909, amounted to only $250,794
ie imports for 1914, although entering at a lower rate of duty
th e last nine months, were only $181,135. From 1914 to
a quantities of foreign silk knit goods were brought into the
market as the countries of origin, chiefly Germany and
re not in a position to supply them. Apparently the

1, p. 126.

stic manufacture of silk knit goods has suffered but little from ncursion of foreign-made articles.

ports for 1910 were about 10 per cent of the domestic production own by the census of 1909, which gave figures for hosiery and rwear only. The prodigious growth of the home industry and ecline in imports left only a very small proportion of the do- c market supplied by foreign silk knit goods in 1914. The ıt of silk hosiery and underwear as shown by the Federal census ased from a value of $4,584,708 in 1909 to $32,779,609 in 1914, o $141,873,000 in 1919. More complete returns in 1914 show oduction of silk knit goods, exclusive of fabrics, valued at 45,598, while imports amounted to only $181,135, or 0.47 per f the American output. An even greater divergence is apparent 19 with a production of $228,398,000 and imports of $29,080.

nce, foreign competition is not a disturbing factor in the silk goods trade unless imports are concentrated in some particular of goods which competes with a similar class made in this coun- Evidence of this can not be obtained from import statistics are not subdivided, and, in fact, the decline in imports, not- tanding a greatly increased consumption, seems to indicate that is no definite part of the domestic market so supplied.

COMPETITIVE CONDITIONS.

erica is the largest user of raw silk, and silk throwing is an ished industry. It is probable, however, that the cost of ing silk in this country is slightly greater than in Europe. stic plants are as well equipped and domestic labor as efficient eign. Wages, it is true, are higher, but this is not necessarily dicap, as many manufacturers themselves recognize when they e maintaining wages as high as is compatible with selling prices. r wages, which are not peculiar to this industry, but general ghout the country, increase the purchasing power of a very class, thus providing the manufacturer of luxuries, such as silk y, with a wider market for his product. Of course, America the same time a possible market for foreign goods made with er labor in countries where, because of the low wages received e workers, the market is restricted to a more limited class.

PREFACE.

› of a series of Tariff Information Surveys prepared by States Tariff Commission and transmitted to the Com-ays and Means. The series covers all of the articles and provided for in the tariff act of October 3, 1913, and ›ecifically provided for. It is arranged in the numerical agraphs of that act.

ases two or more paragraphs have been combined in one In doing this, industrial relationship of the articles has ›d when possible. In those instances where a paragraph reated under a preceding paragraph of the tariff act, › made to this fact at the point where the paragraph numerical order. Where one grade of an article is dutiable ›r grade of the same article is on the free list, the article d under the dutiable paragraph, which appears first in order in the tariff act. In certain instances articles of ›trial relationship and which occur in separate paragraphs iff act have been combined under one paragraph for con-›f discussion. Reference is made to this fact at the point commodities would naturally occur in numerical order.

›t pamphlet in the series is an "Introduction and Index," ›tains:

ntroductory chapter discussing the scope of the series and al method of treatment.

alphabetical index of the articles provided for in the tariff 13, showing the paragraph of the act in which the article ed for and, if discussed under a different paragraph, the ›f such paragraph.

›st of the pamphlets in the series, showing the paragraphs ›les included in each pamphlet.

›y use of this "Introduction and Index," the exact location iscussion relating to a given article or commodity can be ›ed.

› preparation of this report the Tariff Commission had the of Joseph B. Hubbard, Arthur H. Cole, and (in the revision) . R. Edminster, of the textile division of the commission's . Cochran Fisher, of the accounting division, and of others.

CARPETS AND RUGS OF WOOL.

TARIFF ACT OF OCTOBER 3, 1913.

[Text of Schedule K providing for carpets and rugs of wool.]

busson, Axminster, moquette, and chenille carpets, figured or plain, or carpeting of like character or description, 35 per centum ad valorem.
xony, Wilton, and Tournay velvet carpets, figured or plain, and all eting of like character or description, 30 per centum ad valorem.
ussels carpets, figured or plain, and all carpets or carpeting of like escription, 25 per centum ad valorem.
elvet and tapestry velvet carpets, figured or plain, printed on the warp and all carpets or carpeting of like character or description, 30 per centum

apestry Brussels carpets, figured or plain, and all carpets or carpeting ter or descripton, printed on the warp or otherwise, 20 per centum ad

reble ingrain, three-ply, and all-chain Venetian carpets, 20 per centum

Wool Dutch and two-ply ingrain carpets, 20 per centum ad valorem.
Carpets of every description, woven whole for rooms, and Oriental, Berin, Axminster, and similar rugs, 50 per centum ad valorem.
Druggets and bockings, printed, colored, or otherwise, 20 per centum ad

Carpets and carpeting of wool or cotton, or composed in part of either of pecially provided for in this section, and on mats, matting, and rugs of er centum ad valorem.
Mats, rugs for floors, screens, covers, hassocks, bed sides, art squares, and ns of carpets or carpeting, composed wholly or in part of wool, and not rovided for in this section, shall be subjected to the rate of duty herein carpets or carpeting of like character or description.

SUMMARY AND CONCLUSIONS.

s covered.—This report covers wool carpets and rugs. These ified (1) into hand and machine made products, (2) according ype of the weave, and (3) into carpets or roll goods, seamed d seamless rugs. Carpets and rugs are not made by hand United States; the handmade articles are imported chiefly e Orient, and to some extent also from continental Europe eat Britain. The types of machine-made products bear the own names of Brussels, Wilton, Axminster, and others. f these applies to a particular weave. All wool carpetings, ingrain, are pile fabrics, and each of these names signifies a method of inserting the pile. Insertion by knotting the pile around the warp threads by hand is the oriental method. ne-made carpets imitate the oriental in various ways. A newly ed power loom produces an exact imitation of the oriental ; this product is to be considered a type in itself. The pile of ls and Wilton is formed of warp threads, and is obtained by ng these over wires which are later withdrawn, leaving the pile ng above the backing of the fabric. The difference between

the two is that the pile in the case of Brussels remains in a looped condition, while in the Wilton the loops are cut when the wires are withdrawn. Colored patterns in these two weaves are obtained by selection of the variously dyed warp threads in accordance with the color demanded by the design. Tapestry and velvet are imitations of Brussels and Wilton. The weave is the same as for the latter types, but the pattern is obtained, not, as for them, by the use of a number of warp threads each dyed a single color, but by the use of warp threads each dyed in sections with the various colors necessary to form the pattern. The Axminster is a close imitation of the oriental weave, in that the pile threads are inserted in the fabric and are not formed from the warp; it differs from the oriental in the fact that the pile is not knotted to the warp threads but inserted around a filling thread and bound in by additional filling threads.

The pile of the chenille Axminster differs from the Axminster in being formed of threads bound together by a weaving process prior to the rug weaving. The Smyrna is somewhat similar to the chenille Axminster. Ingrain is simply double and triple woven cloth. Some cloths other than ingrain are used for floor coverings. With the exception of Smyrna, which is woven only as a seamless rug, and chenille Axminster and ingrain,[1] made only as carpets and seamless rugs, these types are all woven in the three forms—rolled goods, seamed rugs, and seamless rugs.

Raw materials.—Wool forms the most important raw material; yarns of a wide variety of other fibers, including cotton, jute, flax, and sometimes silk, also are used. The wools required must be of superior strength of fiber, long, lustrous, and straight, and because of the use to which they are put they must be cheap. As wools raised in the United States do not meet these requirements, all of the carpet wools are imported. Prior to the war China, the United Kingdom, Russia, Turkey, and Argentina were the principal sources of importation. Next in importance to yarns as raw materials come dyestuffs. These also must meet peculiar requirements because of the use to which the finished product is put; they must be extremely fast to light and alkaline street dirt, but need not be fast to water to the degree required, for example, of dress goods.

Production.—In 1919 the United States produced 52,173,000 square yards of wool carpeting, valued at $110,116,000; in 1914, 66,340,274 square yards, valued at $69,128,185. These were both depressed years in the trade. In 1909 production had amounted to 81,218,881 square yards, valued at $71,188,152. Earlier figures indicate a comparatively slow growth since 1900.

In 1919, 28 per cent of the yardage produced was Axminster, 21 per cent Brussels and tapestry, 28 per cent Wilton and velvet, and the remaining 23 per cent principally wool and paper fiber usually made on ingrain looms. Since 1900 there has been a marked tendency for ingrain production, other than the relatively new wool and fiber goods, to decrease and for Axminster production to increase; during the same period the production of cut-pile fabrics has tended to increase and that of loop-pile to decrease. In 1919, 23 per cent of the production of all these types was rolled goods, 24 per cent seamed rugs, and 53 per cent, seamless rugs. More than half of the yardage of Wilton and Brussels and almost half of Axminster was in the form of seamed rugs, and

[1] Formerly ingrain rugs were made in appreciable numbers as "mitered" rugs. See p. 23, infra.

hree-fourths of the yardage of tapestry in seamless rugs. Only grain did roll goods account for over half of the yardage. Approximately 45 per cent of the yardage of velvet was made up as roll and slightly less as seamless rugs.

pet mills are confined almost entirely to the eastern section of nited States; New York employed the largest number of wage rs in 1919; Pennsylvania, Massachusetts, and Connecticut d next. The total number of wage earners at that time was 2.

ports for consumption.—From 1910 to 1914 yearly imports ged 1,084,620 square yards, valued at $4,305,149. By far the t number of these were handmade rugs, largely from the Orient; igh not accurately indicated by the figures, it may be estimated approximately 80 per cent were of this description. The next ears, which include the period of the European war, show a decrease; yearly imports averaged only 743,059 square yards, d at $2,725,204. This decrease is marked in the case of handmade machine-made products show an actual increase because of r importations during the first three years of this period. A ery in imports began in the middle of 1919. In 1920 they ased to 1,002,812 square yards; in 1921 to 1,384,388 square

ports, although large in themselves, are only a small percentage oduction. For the calendar year 1914, for instance, imports of ine-made carpetings are estimated to have been 0.7 per cent of quantity produced in this country and 0.95 per cent of its value.[2] he same year imports of all kinds of wool carpeting, including made, formed slightly over 2 per cent of the yardage produced slightly less than 7 per cent of the value.[3]

ports.—Figures for exports during recent years are not avail-

They have been small in amount and sporadic in character, ast in so far as individual countries are concerned.

mpetitive position of American industry.—The carpet industry e United States outranks that of all other countries in the amount oduct. Not only is production in itself large but the individual are of sufficient size in many instances to have the advantages ing from large-scale production. To these advantages are added resulting from the length of time the industry has been estab- l and the advantages gained from an earlier development of anism than took place in other countries. An element of strength e domestic maker has been a market with a consuming power r than that of any other nation. The domestic manufacturer's imity to this market has enabled him to fit his production to the of the American consumer, as he has done in the shift from car- to rugs through the development of wide looms.

competition with European countries, which pay a lower rate than the United States, the American producer is at est disadvantage in those products in which the labor cost forms ge percentage of the total cost. Especially are the imitation tal and the chenille Axminster disadvantageously situated in this ct. The former is produced by only one loom, recently set up in

milar estimate for the census year 1919 would show imports amounting to only 0.16 per cent of the ty produced, but this, of course, was an abnormal year.

he census year 1919 (an abnormal year), approximately 1 per cent of the quantity produced in this y.

this country; the latter meets competition from the product of a highly developed British industry. Among the other fabrics the figures indicate that Wilton (if Smyrna be omitted, which is not produced in Europe) bears the highest labor charge. There are some imports of fine Wiltons, but the American manufacturer has developed a fabric of superior quality.

Profitable hand manufacture of rugs and carpets is not possible in this country. Imported handmade rugs are, of course, used for floor coverings, and in that sense displace machine-made products. As a matter of fact the great bulk of demand for either of these products is uninfluenced by the fact that the other might be used. The purchaser of an oriental or hand-tufted rug wants an oriental or hand-tufted rug and is not to be disturbed ordinarily by considerations of price or the existence of a cheaper machine-made substitute. Only when the long wearing qualities characteristic of some hand-tufted rugs lead to investment in them, as against machine products, can they be regarded as truly competitive.

Suggested tariff paragraphs.—The 11 carpet paragraphs in the act of 1913 occupied a larger portion than is warranted by the importance of these articles, and before the passage of the act of 1922 the United States Tariff Commission suggested that only three paragraphs be used. These three paragraphs were to cover the entire range, subdivided as follows: One to cover wool carpets and rugs that are distinctive luxuries, another to include all other varieties of carpets and rugs made with the use of wool, and a third for special articles made from wool carpets and rugs. Paragraphs 1116, 1117, and 1118 in the present tariff act fully cover these three divisions.

The intent of paragraph 1116 is to include only such carpets and rugs as are distinctive luxuries. Falling within this classification are handmade carpets and rugs such as the oriental, "real" Axminster, Savonnerie, and Aubusson, and also chenille Axminsters which, although made on a power loom, necessitate a large amount of handwork and are costly goods which are in much the same class as handmade goods. There is also included "carpets and rugs of oriental weave or weaves, produced on a power-driven loom." The term "oriental weave or weaves" means woven similar to the oriental; that is, with knotted pile.

Specific duties.—Provision for carpets and rugs may be made on a specific or an ad valorem basis. The acts of 1913 and 1922 provided duties on an ad valorem basis. The two preceding acts employed compound duties. A comparison of specific and ad valorem rates on machine-made carpeting on the basis of the 1920 domestic prices is made for the three acts of 1913, 1909, and 1897, in the following table. Both specific and ad valorem equivalents of the duties are given, and the division between carpets and the two forms of rugs is made.

rem and specific rates of duty on carpets and rugs, on the basis of typical prices, July, 1920. (Acts of 1913, 1909, and 1897.)

d valorem rates of the act of 1913 were 20, 25, 30, 35, and 50 , according to the types of carpeting. With the exception of er rugs, the ad valorem equivalents of the compound duties vo preceding acts, on the basis of 1920 domestic prices, vary ıtly from 50 per cent. The equivalent specific duties for the ts, calculated on the same basis, vary widely, of course, g to the value of the different types of rugs. As between the orms, the specific equivalent of the duty on rugs is the higher of the higher value of the rugs; the relative differences the two forms are less under the compound duties of the ;ts. For the fabrics for which the prices have been taken, luties on rugs would be higher than those on carpets (roll ı order to equal the rates of act of 1913, by the following ;es: Brussels (seamed), 3½; tapestry (seamless), 4; velvet, Wilton (seamed), 25; Axminster (seamless), 27; worsted ieamed), 39; and chenille Axminster (seamless), 53 or 7, to the classification under which it falls. Wool Wilton rugs show a duty greater than the seamed by 3 per cent; r, by 14 per cent. All the preceding differences were slightly ;h case for the acts of 1909 and 1897.

l is not available for a similar table for handmade products. under the act of 1897, the equivalent ad valorem rate pon "carpets woven whole for rooms and rugs" amounted ;er cent, and the specific equivalent to $2.57 per square ıties under the act of 1909 were the same; under that of

1913 the rate was fixed at 50 per cent ad valorem. In 1915 the application of this rate resulted in a duty of $2.12 per square yard. This has increased with the increase in price of rugs until in 1920 it amounted to $4.09.

Compensatory duty.—The proportion which the cost of wool bears to the total cost of producing rugs makes the consideration of duty on raw wool of importance. On a basis similar to that used for specific duties, it appears that a wool duty adding 50 per cent to the cost of yarns would result in an increase in price (all other costs remaining the same) as follows: Wilton, 13 to 22 per cent; Axminster and chenille Axminster, 10 to 13 per cent; velvet and tapestry, 8½ to 10 per cent. A duty adding 25 per cent to the cost of the yarns would halve the above percentages; one adding 12½ per cent would divide them by four, and other additions proportionately

Elimination of wool duties.—Under the act of 1922, it was provided that raw wool in the manufacture of rugs, carpets, or any other floor coverings shall be entered free of duty. With carpet wool free, compensatory duties were of course eliminated and the duties on wool carpets and rugs were placed on an ad valorem basis.

CHAPTER I.

DESCRIPTION.

VARIETIES AND CHARACTER OF MATERIALS EMPLOYED.

ɔt and rug industry utilizes an extraordinarily wide variety ɔers, a variety approached only by that employed in the ndustry. Disregarding the straw, grass, paper, and rags production of cheaper types of floor covering, it should be wool, cotton, flax, and jute are all employed, while in the e of a few handmade oriental rugs silk is also drawn upon. s utilized in the manufacture of carpets and rugs are, gen- ing, of a character quite distinct from the types employed branches of wool manufacture. To be sure, some small f wools that are primarily carpet wools may chance to be ly high grade to find place in cloth or blanket production; ɔnally the desire of cloth designers to produce certain for example, a rough, kempy appearance, leads to the t of a certain proportion of kempy carpet wools. On the considerations of scarcity or price may in special instances use in the carpet trade of certain wools whose primary t is in cloths, blankets, and the like; though even then west quality of such wools can be advantageously pressed

ɪties desired of carpet wools are such as to lead directly to this ɪlassification. Carpet wools must possess superior strength onsiderable luster, straightness, a fair length, and relative ɔm felting, and they must be relatively cheap in price. to these characteristics may be instanced those of the ɪl, which is the wool fiber most highly prized in the manu- ɪloths and dress goods. Carpet wools come from sheep of unimproved breeds. A representative type is the Scotch This wool is the yield from an extremely hardy but rough heep of the Scotch Highlands, the breed of which has been unchanged in many centuries. Other wools of similar ɔme from the (native) sheep of China, India, and south- ɔpe. The wool from such fleeces approaches the character his hairlike quality gives it strength, straightness, freedom g, and usually a fair length of staple. The relatively low serrations contributes luster, while the large production ɔols, together with their general unsuitableness for cloth re, renders them cheap in the world's markets. Techni- rime requisite of carpet wools is strength of staple, since feature depends the resiliency of plush or loop pile and under severe wear; economically the prime requisite is

The wool yarns employed in the carpet industry are manufactured on both the woolen and worsted principles. The manufacture of such yarns for use in the carpet industry is distinguished chiefly by its relative simplicity, as compared with the manufacture of such yarns for other purposes. The good average length and strength of staple, and the relatively low counts of yarns required, free the preparatory and spinning processes from many of the difficulties with which the manufacture of fine wool yarns is beset. Typical counts of worsted yarns for use in the carpet trade are from 10s to 20s, whereas in the cloth and dress goods manufacture they often reach 40s to 60s.[1] Typical woolen yarns for the carpet trade are equivalent to yarns in the cloth manufacture denominated 1 to 1½ run. On the other hand, the average woolen yarns actually employed in the latter industry are 3½ to 4 run, and occasionally one finds woolen yarns spun to as high as 12 or 16 run.[2] Both woolen and worsted carpet yarns are usually doubled or trebled (twisted together) before use in weaving.

The cotton, linen, and jute yarns employed in the industry are, with hardly an exception, purchased from spinners in the industries which manufacture cotton, flax, and jute, respectively. The feature of low yarn counts may be instanced by reference to the types of cotton yarns commonly employed in the carpet trade. They are rarely over 16 count, though two, three, and sometimes as many as five of these "single" yarns are twisted together to form a 2, 3, or 5 ply yarn. On the other hand, the cotton yarns produced in this country are in the main 20s to 40s, while some cotton yarns as high as 120s or 140s are used as "singles" in the weaving of fine cotton cloths.[3]

In addition to the constituent yarns, there are employed dyes, scouring materials, sizing, and other materials of lesser importance. Only dyes present any particular features. Dyes employed in the carpet industry do not need some of the qualities required of dyestuffs in other branches of the wool manufacture—for example, fastness to washing. However, it is essential that they be fast to light in an unusual degree, and to alkaline street dirt. Certain aniline dyes, especially acid dyes, possess this quality in an exceptional degree, and are widely used in the carpet industry.

Section 2. Types of Carpeting.

There are essentially but four distinct types of carpeting: (*a*) Felt carpets, (*b*) knotted-pile and imitation knotted-pile carpets, (*c*) warp-pile carpets, and (*d*) single or multi cloth carpets.

(a) Felt carpets.

This type of carpet or carpeting[4] is manufactured in the same manner as other felted goods, such as felt hats, felted blanketing and the like. The wool fibers are not spun into yarns but are matted

[1] The worsted count is based upon the number of 560-yard hanks to the pound. A pound of 10s worsted contains 10 by 560 or 5,600 yards, a pound of 20s worsted contains 20 by 560 or 11,200 yards of yarn.
[2] The woolen run system is based on the number of 1,600-yard lengths to the pound.
[3] Cotton yarn numbering is based on the number of 840-yard hanks to the pound.
[4] The term "carpeting" is not used in the trade but is convenient for including under one heading both carpets or roll goods and rugs. The single term "carpets" is employed in the trade to cover both forms of floor covering, but this practice leads to considerable confusion when it is desired to differentiate between roll goods and rugs. In this report the practice in the trade is followed except in those cases where to do so would confuse the sense of the discussion.

er by the action of moisture, heat, and pressure to

carpeting had become very small, indeed, under the duty of 50 per cent ad valorem of
and 1909, averaging less than 30 square yards per year in the period 1907–1913. Even in
ity became 20 per cent, the importation amounted to but 5,367 square yards, valued at

machine-made Axminster from which this should be carefully distinguished.

The implements and methods used in the production of oriental rugs are peculiarly simple. The weaving operation itself consists in the formation of a series of knots upon the foundation of the warp threads in such a way as to form the pile, the colors of the yarns used for this pile forming the pattern of the rug. The method of manufacturing European hand-tufted carpets differs from that employed in the Orient in no essential manner. The implements, particularly the loom, are superior, the wool yarns are probably better, designs are different, and the European weavers work almost wholly in central workshops; but the distinctive feature of the operation, the knotting of the pile, tuft by tuft, into the foundation of warp and weft, is preserved without change.

The products of both the oriental and European handicraft manufactures form a class apart among floor coverings, and a class fundamentally superior to all others. As one writer has put it:

> There is no method of combining the pile with the foundation so good as the knot, and it can not be completely imitated by the cleverest power loom invented. The hand-tufted carpet possesses an individuality * * * which no product of machine can attain, and which, after all, is an attribute of a work of art.[9]

Such articles are obviously of the class of luxuries, and inasmuch as there is no production of them in this country and as they compete only indirectly with the domestic machine-made goods, the tariff problem is quite different from that connected with the latter.

Machine-made knotted-pile carpets.—There has been set up in the United States a loom which weaves a fabric similar in structure to the oriental. A row of pile yarns is inserted between the warp threads and the knotting is obtained by mechanically transposing alternate warp threads, which are then restored to their original position. Filling (weft) threads are next inserted, and the process is repeated. This process has been commercially feasible for only a few years and the output is small. A similar fabric is likewise being produced in England and was, some years ago at least, being produced in Austria.

Imitation knotted-pile carpets.—The two types of machine-made carpets in which the action of the hand weaver, or the result of his operations, is imitated are the Axminster and the chenille Axminster. In both the structure of the finished fabric is not unlike that of the handmade article, namely, tufts of wool yarns bound into a foundation of cotton and other yarns. Another fabric, the Smyrna, is an outgrowth of the chenille Axminster method of manufacture and, although it bears little resemblance to handmade carpeting, may conveniently be included in this group.[10]

Axminster.—The Axminster carpet has borrowed its name from the handmade fabric already mentioned, but owes its origin wholly to the inventive genius of Halcyon Skinner, who, with aid from Alexander Smith, developed toward the middle of the last century a power loom for the weaving of the imitation fabric. In the method of manufacture by means of this loom, even as in the old hand process, each latitudinal row of tufts is treated as a unit; but in the machine process the whole row of tufts is inserted at one time instead of each tuft being individually knotted.

---

[9] Brinton, R. S.: Carpets, London, 1920, p. 22.

[10] Axminster and chenille Axminster were covered by par. 253 in the tariff of 1913. Smyrna rugs were not specifically mentioned in that act.

lready dyed), in the number and sequence of colors complexion of a specific row of tufts, are wound wide as the fabric to be woven.[11] A series of these each other in such an order that the succeeding at colored tufts form a continuous pattern. A traveling chain which overhangs the loom, the total spools being dependent upon the number of indi- in a complete single insertion or "repeat" of the e spool required for the particular juncture in the by the moving chain directly above the shed (or p threads (already mounted in the loom), the spool he ends of wool yarns dangling from the wide spool o the apex of the warp shed and formed into a V- mmediately a double shot of filling yarn is inserted, in position; the wool yarns are severed by an auto- point near the spool and sufficiently high from the goods to leave the desired height of pile; the shed of changed to bind in the weft shots and their row of ots of filling are inserted to combine with backing d the row of tufts even more firmly; the reed of the he completed section of the goods; and the particular to give place to the next spool in the series. The repeated, and row by row the fabric is built up.

viously many differences from the hand process in the ns; and many differences in the completed articles . Particularly to be noted is the relatively small pro- yarns used in the machine product. Whereas in the he wool yarns are fixed to a foundation of relatively rns, in the machine Axminster wool yarns form only warp binder threads are of cotton; the stuffer or back- l in the warp is usually of cotton or linen, and jute r the weft or filling yarns.[12] The weight and firmness y the jute and the linen or cotton threads, and the y give the surface.

the quality of the Axminster fabric depends primarily of wool yarn used, the number of rows of tufts per inch rpwise of the goods), and the number of wool-yarn pon the spools. The first two factors mentioned are tant. Both worsted and woolen yarns may be utilized cture of Axminsters. The former makes a superior y ways, but woolen yarns, largely because of their ve come more and more into use for the purpose of elatively cheaper article to compete with the Wiltons that at the present time the American industry em- olen yarns in this type of carpet. By an increase in either rows or wool-yarn ends the density of the pile ut in the case of a greater number of rows the com- e goods is also promoted through the necessity of up by the loom to insert a greater number of rows in In an Axminster, which has 8 to 10 rows to the r firmly held; but in some of the modern fabrics

ess is called "setting."
l is one that appears on neither surface of the fabric, but is used only to [illegible] ys runs longitudinally and is usually composed of jute, sometimes some [illegible] ed.

as low as 4½ rows per inch, the tufts work loose all too easily after period of wear and under any violent treatment such as is applied b the modern vacuum sweeper. To some extent the tendency of th tufts to draw out is checked by the application of sizing to the bac of the fabric. After the carpet is woven, it is reversed and painte with this pastelike solution. In general, the lower the number o rows in the fabric the heavier is the coating of sizing applied. Thi treatment, however, has really no great permanent value. After time the sizing cracks and peels off, and the tufts are again free t come loose.

One of the chief advantages of the Axminster lies in the field o carpet design. By reason of the method of manufacture, the num ber of colors that may conveniently be employed is practically un limited, except by the additional cost of dyeing. As far as the weav ing is concerned, any combination of yarns may be arranged on th spools and inserted into the goods. In consequence, Axminsters hav usually been known for their diversity of colors, even for a tendenc toward baroque and rococo designs. On the other hand, there is practical limit on the length of "repeat" in the pattern. For eac additional row required in the construction of a "repeat" an addi tional spool must be prepared and mounted in the continuous chai overhanging the loom. The usual "repeat" in the Axminster trad is, therefore, restricted to 50 or 75 rows or spools. The constructio of a medallion rug in any such size as 9 by 12 feet, where the numbe of rows or spools may easily run over 450, becomes a very expensiv and laborious undertaking.

The term Axminster is, in the American trade, of rather moder origin. The product of the Skinner-Smith loom was first calle "moquette," [13] and this term was retained in the tariff act of 191 (pars. 293 and 300) although practically extinct in the industry an trade. There are, to be sure, minor differences between the moquett and the present Axminster. By a different arrangement of fillin shots and by variation in the tension under which the binder war threads were held, a ribbed effect was developed on the back of th fabric; and this was the distinctive feature of the moquette goods Subsequently it was found that this ribbed back was not withou disadvantages, especially the tendency for the tops of the ribs to suffe all the wear coming on that surface; a fabric with a flat back was there fore evolved and denominated Axminster. Other terms are als sometimes heard in the trade, such as Crompton, Royal, and Imperia Axminster goods. The first refers specifically to carpets manufac tured on the Crompton type of Axminster loom, a modification of th original Skinner-Smith loom; but names of machines have becom confused and the term Crompton Axminster is frequently applied t any machine-made Axminster. The other terms are drawn from th British Axminster industry, and pertain to Axminsters of particula construction that have been developed and quite widely accepted b the British manufacturers. Like the term "moquette," they ar all variations of a single basic type.

Chenille Axminster.[14]—The distinctive feature of the chenille Ax minster, as compared with the Axminster proper, is the preparatio

[13] This term was originally applied to rugs manufactured in France, and is to-day the French term fo Wilton.

[14] Another name for this type of carpeting, used especially in England, is Patent Axminster, derive probably from the fact that Templeton, of Glasgow, the developer of this fabric, long held a paten monopoly. The term has been retained mainly to distinguish this type from the Axminster proper "Victorian" is another English term used for chenille Axminster.

a the form of tufted yarns, prior to their insertion
of weft and warp threads.
y operation necessitates the weaving of a special

ioned are secured.
s of tufted yarn are cut, they are carried over a
which the surface is fluted. By virtue of the fact
of warp yarns fall into the base of the V-shaped
yarns projecting on either side are pressed upward,
in which position they are fixed by the heat of the
oduct, on account of its appearance, was early
le" or caterpillar; but in the modern manufacture
only designated "fur." The whole process by which
secured is generally spoken of as "weft weaving."
of the "fur" to the foundation fabric (called "set-
de) is peculiar in that hand operation is retained to
extent than in any other type of machine carpet
r the proper shed has been made in the warp threads
inder threads are usually of cotton, and the stuffer,
, a row of the fur is deposited therein, close to the
ed. The fur may have been wrapped on a stick and
d from side to side; it may have been wound into a
l across the loom in a shuttle; or it may be retained
nd laid in the shed by means of a special weft-carrying
perates automatically upon a bar behind the shed of
In any case the loom stops and the fur is gently
he warp. The fur must then be straightened by the
vers (there are usually two, and to a wide loom three
to lie with the point of the V downward, and combed
its proper alignment with the portion of the carpet
. The loom is then restarted, and by a change in the
eating up of the reed the fur is firmly consolidated
ndation fabric. As in the Axminster proper, weft
do not appear on the surface are inserted to hold the
and to give body to the goods. In the chenille trade
avy woolen yarns (often containing a large percentage
mployed in the back for the finer qualities of fabrics,
s for the cheaper types.
tages of the chenille Axminster lie chiefly in the firm
the construction and in the possibility of producing
ual height. The individual pile threads are bound by the
of the "weft cloth," as the fabric is called from which
tained, and the fur is bound to the carpet foundation
r, or more specifically the "catcher" warps in the final
'setting." The height of the pile is controlled by the
ween groups of warp threads in the weft cloth, and a
re-eighths of an inch may readily be secured—as com-

pared with a height of one-fourth or three-eighths of an inch on the usual Wilton or (plain) Axminster. The advantage which the (plain) Axminster possesses of utilizing an unlimited variety of colors also inures to the chenille Axminster, but not without some drawbacks. By changing shuttles in the weft weaving any arrangement of colors may be incorporated into the resulting fur. But a greater number of colors signifies a great complexity of pattern; and the difficulties in "setting" are much increased with this added complexity of design, since each row of fur must be so adjusted and combed that the figures exactly fit. However, at the present time, the fashion in chenilles is predominantly for solid colors—sand, smoke, dull blue, and the like—or in the case of rugs, two-tone effects; and this consideration of design is of minor importance.[15]

Relative quality in a chenille Axminster is determined principally by the character of wool yarn used,[16] by the number of rows of chenille per inch, the height of pile, and the character of the backing yarns. In general, however, the grades of such carpeting produced in this country are of the highest qualities—luxury articles—as, indeed, might have been deduced from a knowledge of the method under which this fabric is manufactured. Chenille Axminsters are probably the finest carpeting, at least in some respects, that are domestically produced, just as they approach nearest to a handicraft method of production.

Smyrna.—The Smyrna rug[17] is unique in at least one respect: it is distinctly an American fabric, being manufactured only in this country.[18] In point of construction it resembles the chenille Axminster, as already intimated. It differs in that the fur is not pressed into a V shape. After the weft cloth has been cut, the strips are twisted, wound on to cops, and so used in the "setting" of the rug. The fiber ends project in all directions from the fur, and as no foundation fabric is employed they project on both surfaces of the finished carpeting, making a reversible piece of goods. The warp yarns are usually of cotton, and the filling yarns which are inserted between rows of fur are usually of jute. Although an excellent fabric in many ways, and although rather expensive, by reason of the large amount of wool contained and of the method of manufacture (being also a semihand process), it is substantially inferior to the chenille Axminster.

The manufacture of Smyrna rugs was at its height 10 or 15 years ago. More recently its production has declined, and to-day it forms an almost negligible portion of the total domestic carpet output.

(c) WARP-PILE FABRICS.

The distinctive characteristic of carpets of this group, which embraces the Brussels, Wilton, tapestry, and velvet types, is that they are pile fabrics in which the warp is the important factor since it

---

[15] Paragraph 293 of the tariff of 1913, which covered chenille as well as (plain) Axminster, contained a qualifying clause: "figured or plain." With respect to the (plain) Axminster manufacture, this clause was of little significance, as few Axminsters are produced in solid colors. With the chenille goods, however, it is of importance. At the present time, a much larger proportion of plain fabrics than of any other type of carpeting is manufactured here. Moreover, there appears to be a substantial difference in costs between the manufacture of the solid and of the figured goods in the chenille industry.

[16] Either worsted or woolen yarns may be used in the manufacture of the fur, but at the present time, on account of cost, the former is only exceptionally employed. Backing yarns, if of wool, are of the woolen variety.

[17] The Smyrna carpeting has been produced only in the rug form. It derived its name from the oriental patterns in which it was at first manufactured, its seamlessness, and its generally luxurious appearance.

[18] It may be for this reason that Symrna rugs have never been mentioned in any of the tariffs.

ture of the manufacturing process, these goods are sometimes called "body Brussels."
to differentiate the goods from the inferior tapestry Brussels.

loom, is the original type of power loom for this sort of weaving, and is still the predominant type. As the shed of the wool-warp yarns is made in this loom, under the control of the Jacquard mechanism, for a particular pick in the fabric, a wire is inserted into the shed. Immediately thereafter the shed of the warp threads is changed, making a loop over the wire of the wool yarns that had previously been raised.[22] By means of the shuttle there is inserted a shot of weft and this, in combination with cotton-binder warp threads, holds and fixes the wool yarns in their position over the wire. Then a certain other group of wool warp yarns is raised to form a shed, another wire is inserted, and so the process continues as the carpet is built up.

After 25 or 30 of these loops over wires have been made and fastened into the body of the goods, the wires are withdrawn in succession from the completed portion of the fabric; as each wire is withdrawn it is immediately utilized in the formation of the loop being made at that particular moment. The withdrawal and insertion of the wires are effected automatically by an almost human movement in the auxiliary mechanism of the loom.

The stationary-wire loom reaches the same end, the formation of the looped pile, by a quite different process. The wires, of substantially the same diameter, run at right angles to those in the draw-wire machine, being placed at right angles to the breast beam of the loom instead of being inserted parallel to it. These wires, long enough to hold 30 or 40 loops, are at first fixed to the breast beam, but as the weaving proceeds become loose in the fabric, held only by the loops which have been made over them. The loops are made by an oscillating motion of the wool-warp yarns or, more technically, a leno motion. After the yarns appropriate to the particular row of loops have been raised,[23] the yarns are made to move to the left and then downward, bringing the yarns over the wires, the points of which extend in among the warp threads beyond the apex of the shed. Thereby loops are formed over the wires. Immediately a shot of filling is inserted to hold the loops. The warp yarns are then moved to the right and back to their original position, forming another series of loops over the wires, which are likewise bound in by a shot of weft. The loom is then ready for another division of the warp threads, suitable for the succeeding row of loops, whereupon the process is repeated. After a sufficient number of loops have been formed, the beating up of the loom forces the loops earliest made off the end of the wires nearer the breast beam, the wires now being loose in the goods; and that section of the fabric is completed. The advantages of this type of loom are real, particularly in that control over the wires, which is so difficult in the case of wide draw-wire looms, is here the same whatever the width of the machine; the space required at the side of the draw-wire looms for the insertion and withdrawal of the wires is wholly saved. It is asserted that there is also an increase in production over the draw-wire loom.[24]

---

[22] The wire is about three-sixteenths of an inch in diameter and as long as the carpet is wide. The difficulty of control over the wire and the space required for the (automatic) insertion and withdrawal of these wires are serious checks on the development of the weaving of Brussels (and Wilton) carpets in broad widths.

[23] In this method, actually two rows of loops are required to fill the place in the design of the fabric occupied by one row under the older (draw-wire) method. The double row, however, may be treated as one.

[24] The manufacturers of the stationary-wire loom profess complete confidence in its advantages over the draw-wire loom and report that these advantages are evidenced in the mills using it; but a prominent manufacturer states that the innovation has not yet been made practical and that its use has, therefore, been very restricted up to this time.

e draw-wire and stationary-wire methods, in ad-

what greater than in a Brussels carpet of the same "pitch" (number of warp ends per inch) and "wires" (rows of loops per inch). The difficulty of controlling the wires in the draw-wire machine, especially in the case of wide looms, which was mentioned above in connection with Brussels weaving, becomes even greater in Wilton weaving on account of this alteration in the shape of the wire.

Third, both types of loom used to make Wiltons are provided with means whereby the loops formed over the wires are severed at their highest point. In the case of the draw-wire machine, this is accomplished by the provision of a small, sharp blade at the extremity of the wire inserted to make the loops. As the wire is withdrawn, this blade severs the whole row of loops formed over its haft. In the stationary-wire machine, the beating up of the woven goods gradually presses backwards the series of loops already douped over the wires and, instead of falling off the end of the wires nearer the loom beam as in the Brussels manufacture, they are forced against a series of stationary knives, which also sever the loops at their highest point. This severance of the loops, and the production of a plush-pile fabric thereby, is of course the most conspicuous feature of the Wilton as distinguished from the Brussels, as in the latter the loops are not cut but left as woven.

Fourth, since the cut pile of the Wilton carpeting acts as a cover, the weft or filling yarns may be of jute or cotton, instead of the linen yarns usually employed in the Brussels carpeting, where the upper filling yarns are more easily observed. However, on account of the formation of a tufted instead of a looped pile, somewhat greater binding force must be exerted by the filling yarns; and accordingly it is quite customary in the better grades of Wiltons to insert three shots for each row of loops instead of two as in Brussels weaving.[26]

The manufacture of Wilton carpet, like that of Brussels, is handicapped by the limitation in the number of different colors which can be used in the production of a single piece of goods. Nor can it rival the Axminster and chenille Axminster in height of pile. However, Wilton makers have generally abandoned the attempt to secure a heavy pile, and by the execution of fine, delicate designs of carefully chosen colors, in a close-clipped fabric, seek to imitate some of the best oriental fabrics. The better varieties of these products are beautiful carpetings, and by some people are considered the best examples of machine-made floor coverings.

The terms "Saxony" and "Tournay velvet" were bracketed with Wilton carpet in the tariff of 1913 (par. 294). Saxony is a term loosely used in the trade, but generally refers to a wool Wilton, i. e., a Wilton with a face of woolen yarns. Tournay velvet, on the other hand, was quite out of place. Although the term is rarely employed at the present time, it doubtless referred to a specially fine quality of tapestry velvet carpet.

Tapestry.[27]—The general appearance of the tapestry carpet is not materially different from that of the Brussels carpet; and, as the older and perhaps more proper name of the goods—tapestry Brussels—

[26] This latter point pertains to draw-wire weaving. In weaving by the stationary-wire loom, no increase in filling yarns is made.

[27] The term "tapestry" was originally used to designate the particular type of weave by which tapestry and velvet carpets are constructed. The earlier nomenclature of these goods was "tapestry Brussels" and "tapestry velvet." In the American trade, however, these appellations have been shortened into "tapestry" and "velvet," respectively.

› the object of the manufacture.[28] On the other hand, ›n of worsted yarns is much less per yard of carpet than › goods, where the yarns not required for a particular re buried in the body of the fabric.

try carpet there is but one set of (worsted) warp yarns. ies the entire face of the carpet and carries the whole lly it is by means of printing each warp thread in a suc- rs that diversity of colorings is obtained; in the manu- ssels this is accomplished by the use of frames. The nade possible by this method are, indeed, much more can be obtained in Brussels. Almost universally the ı-printing process is used to prepare the warps. In this arp threads, dyed a single color or not according to the ound upon the circumference of a large drum, 6 to 18 ɛr and 2 to 8 feet in width of face, set to revolve vertically through its center. The threads wound upon it are nsverse bars of varying breadths and colors, in accord- plan of the design. The printing is accomplished by troughs and rollers which run on rails to and fro across ınd below the drum while stationary. It is then revolved n next required for the particular color used. After all o be dyed in that color are completed, other sections are d to the colors required. When a number of groups or such yarns sufficient to complete the total number of in the fabric have been printed—each warp yarn with a ıngement of color spaces requiring a special printing— varp threads are assembled and run upon a loom beam :equired by the design of the goods.[29]

ılled tapestry carpets are woven of undyed yarns, and a special type of cylindrical printing machine the various ed by the pattern are simultaneously impressed upon fabric. Because of the difficulties in obtaining satisfac- gh impregnation of the (worsted) yarns after weaving and ıe tendency of the dyes to spread, this method of produc- :ally considered inferior to that in which the design is he warp before weaving.

ng process, whether with printed or plain warp yarns, is simple, at least as compared with most types of carpet ince only one set of (worsted) warp yarns is required, there ›le, no occasion for the use of the Jacquard mechanism as manufacture—a mechanism which always complicates n and retards production. In this weaving, the draw-wire ›loyed, similar as far as that attachment is concerned to re loom of the Brussels trade. The stationary-wire loom, ıown, is not used in tapestry manufacture.

ıt and bulk of the carpet, which in the case of the Brussels l largely by the (worsted) warp yarns submerged in the › fabric, are obtained, in the case of the tapestry, by the ater number and weight of jute and cotton yarns than are Brussels. Two and sometimes three stuffer warps are

this assembly and beaming is called "setting."

inserted, and jute yarns are very often employed for fillings in place of linen, as in Brussels. Besides adding to the weight of the goods, this utilization of jute fillings serves the purpose of cheapening their cost, an important feature, since the tapestry can not compete with the latter on the basis of quality. Linen filling is also used, however, to a considerable extent.

While economy in the use of worsted yarns is an important advantage in the manufacture of tapestry carpet, this type of carpet is produced at a disadvantage in several respects: (*a*) The drum-printing operation is quite expensive, involving as it does considerable hand labor; if fabric printing is resorted to, the results, as above stated, are not wholly satisfactory. (*b*) Even in drum-printed tapestries, the colors in the design are often not as distinct as in the Brussels goods. In spite of all precautions, colors in the different sections of the warp threads are liable to run into one another and to show in the finished fabric. (*c*) By reason of the peculiar technical character of drum or fabric printing, it is uneconomical to produce small quantities of a design. Two or three hundred pieces of a single design must be run off.

Velvet.[30]—In appearance the velvet, or tapestry velvet, carpet is made to imitate the Wilton above described, while in method of manufacture it follows generally that of the tapestry or tapestry Brussels carpeting. The differences between it and the tapestry are, accordingly, for the most part similar to those which distinguish the Wilton from the Brussels; the employment of both worsted and woolen yarns; the somewhat greater consumption of wool yarn in a fabric of the same "pitch" and "wires" per inch; the use of a wire to which a blade for cutting the loops is attached[31]; the usually greater number of weft threads; and the somewhat lower "pitch" or number of wool warp ends to the inch. It may be added that to obtain cheapness of product, the tendency in the production of velvet, as in that of tapestry, is predominantly to employ woolen yarns rather than the finer but more expensive worsted yarns.

(D) SINGLE OR MULTI-CLOTH CARPETS.

The carpetings included in this category are quite diverse, but all have the characteristic of being merely plain-woven fabrics. The weaves are not dissimilar to those employed for cloths, blankets, and the like, but unlike any of the carpets heretofore considered these goods possess no pile either of the plush or looped character.

The single-cloth fabrics, which include almost the extremes of carpet types, may be briefly described. The Aubusson, a hand-made "tapestry" made by French weavers, is a plain woven article, although wide diversity of colors and intricacy of design are introduced by means of frequent changes in weft threads.[32] The

[30] Both the terms "velvet" and "tapestry velvet" were employed in the tariff act of 1913 (par. 296). As in the case of the tapestry carpet paragraph, the addition of the phrases "figured or plain" and "printed on the warp or otherwise" were of significance. However, the use of machine printing is not so wide in the velvet manufacture, largely by reason of the difficulty of forcing the dyes from the cylinders into a tufted fabric.

[31] As in the case of the tapestry carpet, only the draw-wire loom is employed.

[32] The Aubusson fabric was specifically mentioned in pars. 293 and 300 of the tariff of 1913, though the other goods included in these paragraphs are all tufted carpets. It is to be noted that although the Aubusson is woven as a single-cloth fabric, it is backed with a felt or other cloth before it is placed on the floor for use.

e consists of coarse handmade carpetings, mainly
sually from India. These are composed of heavy yarns,
rincipally of goat, cattle, or other hair, and are piece-
rinted in the simplest patterns. The trade name "drug-
applied to them.[33]

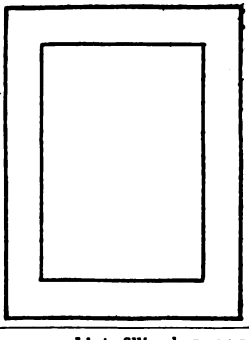
(4)



as "a coarse, heavy carpet woven in stripes and similar in appearance to ingrain carpet"; and the latter as "a species of inexpensive ingrain carpet made of a worsted or cotton warp and a jute filling." It is questionable whether wool Dutch carpeting was ever manufactured in the United States; at the present time both are negligible if not nonexistent portions of the domestic trade.[38]

SECTION 3. FORMS OF FINISHED PRODUCT.

There are four forms in which carpeting has been made ready for use: Carpets or roll goods, mitered rugs, seamed rugs, and seamless rugs. Of these, seamless rugs, in the guise of oriental rugs, were undoubtedly the first to be used. They have, however, been the last of the forms, at least of the larger sizes, to come under machine production. The second form, the mitered rug, is a negligible portion of the domestic trade.

(A) CARPETS OR ROLL GOODS.

Carpets or roll goods are narrow fabrics in which a design, if there be one, is repeated continuously the whole length of the piece. (See No. 1, chart A.) The widths employed are customarily 22½, 27, and 36 inches, of which the 27-inch width is most common.[39]

[38] Obviously, a Venetian of cotton warp and jute filling has no proper place in Schedule K.

[39] The ingrain manufacture is unique in using the 22½ and 36 inch widths almost entirely. Again, the chenille Axminster is usually woven in much wider breadths than any specified above, i. e., in 9-foot widths or greater.

20 years ago such carpeting was the chief type used in ates. Hardwood flooring was rare and the floor spaces s were completely covered with goods of this description.
carpeting were sewn together in such fashion as to continuity of the pattern and were cut at the edges of actly to fit the contours.
rge use for these narrow goods in former times was as stairs, although here the design was generally different itable for the covering of rooms. But since hardwood ıave come into general use the employment of stair cov- so markedly declined.
s is the simplest form of carpeting to manufacture, pre- esign is not unusually complicated. In the manufacture r relatively few spools need be prepared, and these can : and over again; in the making of Wilton and Brussels l cards need be cut, and these may be similarly used; and ıry and velvet manufacture the warps may be printed in ties. Practically all factors favor quantity production.
ds reach the retailer in the form of rolls, as the name mally made up in lengths of 45 to 50 yards, and are cut ler to suit the requirements of the consumer.

(B) MITERED RUGS.

introduction of hardwood floors and the growing demand s first stage was to utilize existing facilities. Strips of roll sewn together to form a central portion of the rug; a der, not unlike the stair coverings, was woven and at- he edges of the center; and in the corners, where the rder met, a diagonal seam was made, joining the two preserving as far as possible the continuity of the border ee No. 2, chart A.) The formation of this corner seam "mitering," and accordingly this type of rug came to be "mitered" rug.
e of rug merely served as an expedient. The design of the which formed the center was often broken at the edges border was sewn on, and the figure in the border itself did not match exactly at the corners. Again, the mitering ners not only caused an appreciable waste of the woven unavoidably left a mound which marred the smooth lay ls. Consequently, when other, more perfect types of rugs the mitered rugs fell into disuse. At the present time they considerable portion of the domestic production.

(C) SEAMED RUGS.

roduction of the seamed form the design is made for the hole and is subsequently divided lengthwise into two, three, ctions or strips, the number depending upon the width of Inasmuch as narrow or carpet looms do not weave goods ıches in width, a seamed rug which exceeds 6 feet in width mally be woven in three parts. A rug 9 feet wide is usually

woven in four parts.[40] In such a rug each of the two outer sections or "rug parts" carries the corner squares, which are longitudinal strips of border, and over the greater part of its length it carries also usually a small edge of the design of the center portion. The other two sections or "rug parts," which form the middle strips of the completed rug, carry the design at either end.[41] No. 3 of chart A shows the normal division of a rug 9 by 12 feet, a standard size of rug.

It is obvious that the manufacture of seamed rugs is more complicated than that of either roll goods or mitered rugs. The complications are important to an understanding of the tariff problem in connection with the carpet industry and require consideration in some detail.

(*a*) With respect to actual manufacturing processes: The complexities in the case of seamed rugs are increased all along the line from designing through to the baling of the finished rugs. These complexities arise mainly from the initial differences in design. It might seem that while the pattern for a piece of roll goods need not be greater than to cover an area 3 or 4 feet in length and 27 inches broad in the finished fabric, the pattern for a rug must cover an area in the goods equal to the whole area of the finished article. But a closer examination of rugs will show that, with the exception of certain handmade goods, all rugs may be divided by lines between the medians of the sides into four sections similar in design,[42] so that even in the case of the most intricate design, that of a medallion rug (see chart B), it is necessary in order to outline the pattern to cover only one-quarter of the surface of the completed product; that is, a length of 12 running feet 27 inches in width. In most other rugs it will be found that there are "repeats" in both center and border of the fabric. Thereby the requisite pattern is further curtailed. In place of one to cover 12 running feet of fabric in a medallion 9 by 12 rug, it may suffice to outline a pattern to cover only 4 or 5 running feet in completed goods. (See also chart B.) This latter area is not over twice that required for most roll goods.[43]

In spite of such opportunities for the simplification of the manufacturing operations the following difficulties remain: (1) The minimum normal rug pattern runs twice as elaborate and extensive as that of the average carpet pattern; (2) each size of rug requires a separate pattern even though they all preserve the same general scheme of color and design;[44] and (3) not merely is the work of pattern preparation itself increased by the enlargement of pattern, but the work is also increased in subsequent manufacturing processes. In the manufacture of Axminster, the number of spools to be "set" is increased; in the Wilton and Brussels, the number of cards to be cut; in the chenille Axminster and Smyrna, the varieties

[40] The woven sections are called "rug parts" in the industry.

[41] In the British carpet industry this form is called "Cairo" or "Chlidema" squares.

[42] The term "design" is here used to mean conception or general color scheme; and "pattern" to mean the conversion of that "design" to a workable form on point paper or the like.

[43] In the actual weaving operation, the case of a repeat such as that in the medallion rug—a "repeat" of a whole half a strip—the conversion of design into fabric is effected, for example, in the Axminster or Wilton manufactures, by reversing the action of the series of spools in the movable chain, or of the series of cards in the Jacquard mechanism. In the case of a repeat in center and border, which normally move together, the series of spools or of cards that contain the repeat are used over and over, the corner sections in the border strips and the border sections in the middle strips being used but twice in the manufacture of a single complete rug part.

[44] The design in the detail of elaboration suitable for a 9 by 12 rug would be much too detailed for a rug half that size; and vice versa the sketchy design for a mat would be ill adapted to a large rug.

[45] mence training on the weaving of roll goods.

(*b*) The likelihood of the production of imperfect goods is greater in the case of seamed rugs than in that of roll goods. The rug parts going into a specific rug may have been woven on three or four different looms, any of which may have been slightly out of adjustment; and as a result one or more of the strips may fail to match. A slight mismatching is remediable in the finishing processes, especially in the case of the cheaper types of carpeting. The goods may be shrunken or stretched and so made to match. In some mills the slightly uneven strips are sewn together as they come from the looms; the back of the rug is then given a coat of sizing and placed on a frame to dry. The fabrics treated in this way will lie flat and even, at least for a time.

The following table presents statistics collected by the Tariff Commission on the production of imperfects by several companies during the last six months of 1919:

Production of perfect and imperfect carpeting, comparing carpets and rugs, last six months, 1919.

	Roll goods.		Seamed rugs.		Seamless rugs.	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.
Mills reporting (number)	2	3	6	6	5	7
Total production (square yards) perfects and imperfects		$3,182,481	1,607,965	$6,369,056	2,141,135	$4,912,979
Production imperfects (square yards)		60,733	89,758	189,382	71,477	131,321
Ratio of imperfects to total production (per cent)	2.76	1.91	5.58	2.97	3.34	2.67

For the firms reporting, the proportion of imperfects produced in making roll goods will be seen to be the least, while that of seamed rugs is the highest, with seamless between the two. In yardage, the proportion of imperfects produced in the manufacture of seamed rugs is twice that in the manufacture of roll goods, while the proportion produced in the manufacture of seamless rugs is three-fifths of that in the seamed.

Should a rug part be seriously defective, the loss to the manufacturer is proportionately much greater than that from a defective piece in a roll of carpet. In the latter case, the portion affected is merely cut out of the roll; and the rest, down to a 20-yard strip, may be delivered as perfect goods. A spoiled rug part, on the other hand, can at best be matched with equally defective strips from the other sections of the rug, and the whole article sold as seconds; the return from such an article is a small percentage of that from a perfect piece of goods. Often such defective rug parts are at once sold for what they will bring without any attempt to make them into whole rugs.

(*c*) Some small loss of time occurs in the manufacture of rug parts by reason of the "drop-lea" or intermediate space woven of backing threads between any pair of rug parts as they come from the loom. However, inasmuch as the "drop-lea" when cut and turned under serves to bind the ends of the rug, it is questionable whether the insertion of this piece is wholly waste. Moreover, the piece is only 3 or 4 inches in length, and in the weaving of a series of, say, 12-foot strips, the loss through this means, though real, is a minor consideration.

(D) SEAMLESS RUGS.

ıg may be defined as a rug over 36 inches wide woven
(See No. 4, chart A.) The limitation as to width is
of the necessity of distinguishing seamless rugs
t are called in the trade "mats and runners." From
of construction there is no real difference. Mats and
ıtially small or odd-shaped seamless rugs, the differ-
n mats and runners, of course, being on the basis of

of wide reed space are necessary for the manufacture
In this respect the peculiarly fortunate position of
xminster industry may be particularly noted. By
ical considerations, especially the nature of the actual
tting" process, looms in this manufacture have always
rather wider than in other branches of the carpet in-
ey were further broadened with comparative ease to
demand. At the present time a loom 9 feet wide is
·ed a wide loom in this branch of the trade. Many of
ıre 20 feet wide, and some as wide as 30 feet. In

, and 15 foot lengths.
'Ingrain type are called "art squares" in the trade.
s up to 6 feet in width produced by the British were employed in this country but the
e practically all German.

As compared with roll goods, the intricacies of manufacture are increased in the case of seamless rugs in somewhat the same ratio as in the case of seamed rugs, especially with respect to the greater complexity of pattern and the effects following therefrom. Moreover, the completed rug must lie smooth on the floor, but by reason of the possible variations in tension of the warps and beat-up of the reed in the operation of such a large mechanism, this end is not easy to attain. This type of weaving is generally considered the most exacting of all in the carpet industry, and only highly skilled operatives are assigned to it. Finally, it is to be noted that production is substantially slower upon this type of work, and this together with the costly character of the machines themselves, makes it an expensive type of weaving.

(E) SUBSIDIARY FORMS.

While carpets or roll goods, mitered rugs, seamed rugs, and seamless rugs are the only primary forms of finished product, the paragraphs of the act of 1913 mentioned a few subsidiary forms. These were:

"Carpets of every description, woven whole for rooms" (par. 300): This phrase, together with that of "rugs for floors" (par. 303), can not be construed as meaning other than carpeting in the rug form. The former might suggest seamless rugs, while the latter would include all types; and "carpets * * * woven whole for rooms" might be otherwise interpreted to signify rugs woven on special order. However, beyond the fact that the rug form is specified in both cases, the meaning is far from clear.

"Mats" (par. 303): Mats have already been described as small seamless rugs not over 36 inches in width, and of less length than runners.

"Screens, covers, hassocks" (par. 303): The three articles enumerated here are really manufactures of carpeting. They have been mentioned in every tariff law since 1867, and may at some time have been significant means of utilizing carpeting. At the present time, "screens" and "covers" are unknown in the carpet trade; and hassocks are a negligible factor.

"Bed sides, art squares" (par. 303): The term "bed sides" also dates from the tariff of 1867. Presumably it referred then to mats or runners used as the name suggests, but the term has long since ceased to be used in the trade. On the other hand, "art squares" are seamless rugs, not always square, of the ingrain manufacture. The term is still employed in the trade, although dying out with the decline of the ingrain product.

[illegible]

Two important [illegible] this tariff hinge upon the form in floor [illegible] and "rugs," in [illegible] in cost of [illegible] roll goods [illegible] discussed [illegible]

It is [illegible] The following [illegible] relating to the

[illegible]

rpets and rugs under section 904 of Title IX of the

ld to be distinguishable from carpet when manufactured as one
he manufacturer from breadths which are united so as to form
inctive manufacture, size, shape, and design, figured or plain.
y the yard and sewed together so as to produce a certain size or
e purchaser, shall not be deemed to be a rug within the meaning
axable, even though made principally of wool.

cs the distinguishing feature is the form in which the
n; when made singly, or woven continuously, with a
en them, they are rugs. With respect to chenille
s circumstances are peculiar. The manufacturers of
ter turn out considerable quantities of carpeting of a
) or 12 feet in width. This carpeting is sold to the
rm of a roll. If a customer desires to cover a space 9
r will cut off and bind under a piece of that size, and it
purpose as a rug of those dimensions; but in the in-
erally held that this is not properly a rug.
ods the distinguishing feature is the design or pattern.
r roll goods there is wide latitude as to design. Pro-
strips of carpeting are matched at the seams when
ogether, such goods may be made to cover any given
other hand, the essential characteristic of a rug is
lesign within a given area. Four strips of carpet, 27
d 12 feet long, may be sewn together side by side,
over the same area as a 9 by 12 rug; but the article
will not be a rug. If a border be attached to the
fabric mentioned above, as borders were sewn in the
ered goods, then the article does become a rug in
se of the word. The border, either woven into the
seamed and seamless rugs above described, or sub-
hed to a central part, limits and in that sense com-
n. Under this definition, it may be added, mats and
ady intimated, are truly but small rugs.
uestion arises: "Into what category does a roll of 'rug
In the manufacture of seamed rugs several strips of

CHAPTER II.

DOMESTIC MANUFACTURE.

SECTION 1. RAW MATERIALS AND THE TRADE IN THEM.

(A) SOURCES OF WOOL SUPPLY.[1]

With respect to the material of chief value, wool, the requirements of American carpet manufacturers in the matter of quality differ in no particular from the requirements of such producers the world over. The type of fiber desired is a strong, even if coarse, staple possessed of considerable resiliency and luster and available at a low price.

Wools of this character have never been produced to any appreciable extent in this country. As long ago as 1866 a brief prepared by American carpet manufacturers stated: "In the manufacture of carpets *no domestic wools are used*, for the reason that they are not only too costly but too fine to make a serviceable fabric." [2] In fact, from the time that the production of carpets on any considerable scale was launched in this country up to the present day the proportion of domestic wools normally consumed has been negligible. Even under the stimulus of a duty on carpet wools (Class III wools), which at times has amounted to as much as 40 per cent ad valorem, no domestic production of wool suitable for the carpet trade has developed, the reason being that the return from wools of superior quality, which could be produced with little greater cost, was much larger. Some small quantities of abnormally low-grade, coarse domestic wools, particularly from the Southwest, have been employed in this manufacture, and some noils and wastes from superior wools have been used in the production of filling yarns; but the ratio of these materials to total consumption of wool in the carpet industry has been so low that the statement of the carpet manufacturers in 1866 has always remained substantially true.

Some changes have occurred in the sources of supply from time to time. The chief sources during the years immediately preceding the World War were China, the United Kingdom, Russia, Turkey, and the Argentine. The British East Indies should perhaps also be mentioned as of some importance. The United Kingdom held the primary position from 1891 up to 1904, but China has come first in subsequent years, owing in part to the increase in direct shipments from China to the United States, but mainly to the change in preference among domestic consumers in favor of China wools. Furthermore, wool from other sources, such as the British East Indies and

ɔn of the statistics showing the imports of carpet
further that the tariffs upon such wools have had
the quantity brought into this country. The aver-
ɜ under the several tariffs were as follows:

indeed, this recovery appears already to have taken place. Domestic imports
ot fall off during the war to the same extent as from Russia and Turkey—were
year 1920 (37,182,717 pounds) than during any other year since 1900.

Table 1, average imports for consumption, per year of 365 days, of Class III wool, under various tariff acts, are found to contrast as follows:[1]

Tariff acts.	Days in operation.	Average per year of 365 days.			Equivalent ad valorem rate.	Relative annual quantities (imports for 1890 used as basis).
		Quantity.	Value.	Duty collected.		
		Pounds.			*Per cent.*	
1890	1,422	74,957,776	$7,334,430	$2,427,286	33.09	100
1894	1,062	121,940,233	11,829,497	.....	.....	163
1897	4,394	91,114,151	10,283,922	4,092,614	39.80	122
1909	1,520	103,915,186	13,732,964	5,150,522	37.50	139
1913	3,275	90,288,612	21,591,301	.....	.....	120
Five acts	11,673	93,385,794	13,686,770	[2] 2,506,926	[2] 18.32	125

[1] This contrast of imports for consumption of Class III wools (including Class III camel hair) under five tariff acts covers the priod of 11,673 days from Oct. 6, 1890, to Sept. 21, 1922, inclusive.

[2] Duties collected per year under the acts of 1890, 1897, and 1909 averaged $3,485,808, and the equivalent ad valorem rate during these three dutiable periods averaged 37.98 per cent ad valorem. Table 1 is a condensation of a more complete table, showing imports for each year, given in Appendix A.

It will be observed that the average annual importations under the free-wool provisions in the tariffs of 1894 and 1913 were little different from the imports under the so-called protective tariffs of 1890, 1897, and 1909.

The fluctuations in importations will be seen, if the imports year by year are examined, to follow more closely the movement in general economic conditions of the country than in tariff changes. After the economic crises of 1893, 1900, and 1907, there were marked drops in the total amounts of wool brought in.

One important conclusion may be drawn from the peculiar feature of the importations referred to—the failure of the inward movement to respond to a reduction in tariff rate, together with the known lack of a competitive source of supply in the United States; namely, that the duties levied in preceding tariffs on the imported material have been passed on by the domestic users to the ultimate consumers of the completed carpets. As a revenue measure, the duty on carpet wools no doubt has some points in its favor; but it may be noted that carpet manufacturers have to a limited extent been handicapped by the import duties on Class III wool, through the necessity of carrying their stocks of wool in process of manufacture at the higher, duty-paid prices.

(C) ORGANIZATION OF THE WOOL TRADE.

The chief market for carpet wools in the United States is Philadelphia, although New York and Boston are centers of some importance. This localization follows that of the carpet manufacture. The latter is concentrated in a peculiar degree in and about Philadelphia, with scattered factories in the States of New York, Connecticut, and Massachusetts.

The firms dealing in carpet wools are to some extent specialized, handling wools from particular regions such as China and East India. Other firms are dealers in a wide variety of carpet wools and sometimes in wool of better quality. A few firms in the trade possess international connections, having agents and offices distributed over most of the wool-producing and wool-consuming countries of the world.

Importing dealers, except those with offices or agents in the wool-producing countries, purchase mainly from exporting merchants in

entina, and the other carpet-wool areas. The lat-
ool from the interior, through native dealers or
agents; sometimes grade it roughly and bale it,
oment to the consuming countries. Sales effected
ie result of private negotiations between the ex-
porters. Auctions are another source of supply,
India wools. These auctions, which regularly occur
in the past been the chief means of distribution
y India wools to the wool-consuming countries of
inent, and the United States. But in two respects
through these auctions has been altered during
e larger American carpet manufacturers have sent
atatives to Liverpool and have thus purchased the
tead of through American importing merchants.
of Indian wool directly to American ports and
ing merchants have increased, and the Liverpool
likely to play the part in the carpet-wool trade
played in preceding decades. One effect of these
not escape attention. Under the earlier situa-
manufacturers and merchants enjoyed certain ap-
ges. Not only were they able to secure first choice
ip at these auctions, but, by virtue of proximity to
rtation charges to the British carpet factories were
than the charges, including those for lading and
hich American purchasers had to pay. Through
ith Indian, Russian, or other merchants, as well as
d in the various carpet-wool countries, American
abled to compete for such wools at their places of
transportation directly to this country there is a
ing in freightage and other costs. By representa-
erpool sales, American manufacturers, of course,
nt of intermediate profits to merchants and brokers.

carpet manufacturers has been materially strength-
ie acquisition of wool supplies is concerned.

b) TRADE IN OTHER RAW MATERIALS.

other than wool are purchased by American carpet
with hardly an exception, in the form of yarns already
f of these yarns, at least from the point of view of
The raw jute is produced wholly in India, whence
o this country. Some small importation of yarns,
tland, has occurred in the past—for example, 1,338-
re imported for consumption in 1914—but as the
jute yarns in the domestic carpet industry in that
imately 59,000,000 pounds, the importation would
l any considerable part had it all gone into the pro-
ets. Obviously, therefore, the jute yarns used in the
et industry are, in the main, manufactured in this

which are next in importance, are of domestic origin
ct to the raw material and to the fabrication. Prac-
n yarns for the carpet trade are imported.

1921, it is true, imports of jute yarn amounted to 9,391,090 pounds—an unprecedented this was but a minor portion of the total consumption.

The flax employed in the manufacture of linen yarns, the only other material of major significance, is practically all produced abroad. Before the war, Russia was the principal source of supply, while lesser supplies, though generally of superior quality, came from Ireland and Belgium. It has been imported in the unmanufactured form, and worked up in domestic flax-spinning mills. There has, to be sure, been substantial importation of linen yarns, but not of the counts commonly employed in the carpet industry. Hemp yarns (generally of domestic manufacture, from Italian hemp) are also used to some extent.

This peculiar situation of the American carpet manufacture with respect to its materials should be noted; aside from perhaps a small amount of domestic hemp, only the cotton used in the industry is produced within the United States, and that forms probably less than 15 per cent of the total weight of materials consumed. Wool, jute, and flax are all of foreign origin.

SECTION 2. METHODS AND MECHANICAL EQUIPMENT.

(A) INVENTION OF MACHINERY.

The picture presented by a summary (necessarily omitted here) of the chief inventions in the carpet industry is extraordinary. Few American industries can show such a record of ingenuity and independent development; in some ways the most encouraging feature of the situation is the continued effort of the American manufacturers and machine builders and their continued success. They are not without competition from Great Britain, but apparently they are able to hold their own. With respect to the manufacture of the machines actually in use the situation is not so favorable.

(B) DEVELOPMENT OF WIDE LOOMS.[5]

The development of wide looms in the carpet industry forms a special feature in its history. It marks the definite ascendancy of the rug production, as contrasted with the carpet or roll-goods manufacture; and it has been the source of greatly increased expenditure by carpet mills for necessary equipment. To be sure, a majority of the looms used in the carpet industry, whether in the United States or in Great Britain, are still of the narrow type: but the wide type is spoken of throughout the trade as the "coming" loom. In the American industry, 3,286 "rug" or wide looms were reported in 1914, as compared with 6,423 "carpet" or narrow looms. In the mills from which the commission secured direct returns of equipment, 1,854 rug looms were reported, and 4,831 carpet looms.[6]

[5] See Appendix D, pp. 128, 129.

[6] These looms were divided as follows:

	Rug looms.	Carpet looms.
Brussels and Wilton	68	1,593
Tapestry and velvet	[a] 949	[b] 1,199

are, on the whole, distinctly favorable to the American ıe proportion of foreign-built looms employed in the velvet, Axminster, and even in the rather recently nille Axminster manufactures is really unimportant. ıber of machines are likely to be imported for purposes

of experimentation, to fill particular needs, to please particular foremen or manufacturers, and for other incidental reasons. Unquestionably the domestic market for the above-mentioned types of loom is controlled by American machine makers.

With respect to the Brussels and Wilton looms, however, the situation is not so satisfactory. The number of narrow machines of British makes is slightly greater than the number of such domestic-made machines; and in the matter of wide looms, somewhat over one-third are of foreign origin. The greater number of the imported wide machines have come from Great Britain, but some of the widest (9 feet wide, for example) are understood to have come from Germany.

Smyrna looms are entirely of domestic manufacture, as is to be expected from the fact that the rugs themselves are made entirely in the United States. Looms for weaving ingrain, the manufacture of which has been the longest established among the different types of carpetings, are of domestic make.

This special condition in the Brussels and Wilton manufacture is due in part to historical and in part to technical causes. The power loom evolved by Bigelow for these goods was taken up actively by the British carpet manufacturer Crossley, who purchased Bigelow's patent rights for the United Kingdom. It was to a considerable extent improved by him, and the production of these looms established in that country; this fact explains the large proportion of looms of British origin instanced in the figures of Table 2. The British machine makers have, moreover, always been known for the excellence of their work. An example of the difference between English and American practice in this line, at least of some years ago, is furnished in connection with the ingrain looms of American design which were imported into the United Kingdom. It is reported that the Murkland and later the Crompton and the Knowles looms of this type were borrowed from the American industry. The first were of American construction. "They were, however, soon superseded by productions of English makers, as the American were found too poor—castings being used where hammered iron and steel are employed in the English loom."[7] However, the substantial and, it is believed, increasing proportion of American-made machines employed in the domestic industry, together with the recent development in the stationary-wire loom for this manufacture, indicates that some of the obstacles in the way of production within this country of machines for use in the Brussels and Wilton weaving have been overcome.

Section 3. Size and Character of the Domestic Industry.[8]

(a) Growth of the Manufacture.

The beginning of carpet manufacture in this country dates back to the last years of the eighteenth century. No record exists of the domestic production of carpets for sale prior to 1790, and of course the first attempts at manufacture were on a very small scale, practically handicraft work. Indeed, the advance before 1860 was particularly slow and halting. The census of that year discloses an industry in which the number of "hands" per establishment was only 31. The manufacture, then, was really on a work-shop basis.

[7] Special Consular Reports, 1890, "Carpet Manufacture in Foreign Countries," p. 299.
[8] Based on census figures for 1919.

nd 1890 the industry made its most rapid growth, of employees rising from 6,683 in the former year atter. Subsequently the rate of its expansion de- d the maximum in number of wage earners, 33,307, is an increase of only about 15 per cent in 20 years. ber of wage earners had absolutely decreased to 9 to 22,933, but that may be explained by peculiar ons. Other statistics, however, indicate that the stood still during these years, although if measured hands employed a slowing down is obvious. For al invested has increased steadily from 1890 to the 1860 it was reported to amount to $4,721,938; by 8,842; by 1914, $85,153,828, and by 1919 it had 461. Obviously the amount invested has increased the number of employees. Thus the amount of capi- employee in 1860 was $707; in 1890, $13,297; in in 1919, $5,196. The increase in the last 25 years eworthy. Again the statistics of the value added .. e., the value of the products above the cost of the e shows sustained progress by the industry. From 790 in 1860 it reached $19,125,288 in 1890, $26,847,- 35,789 in 1919, and $53,156,000 in 1921. The 1914 was a decline from that reported in 1909,[9] $31,625,- able on the ground of depressed business conditions. ustry is in a healthy, expanding condition, although especially to its working force in recent years.

(B) GEOGRAPHICAL DISTRIBUTION.

re of carpets is an exceptionally concentrated indus- it confined to the northeastern tier of States, but to hat group, namely, Pennsylvania, New York, Massa- rsey, and Connecticut, arranged in sequence accord- er of establishments in each State. The details of distribution as of 1914 and 1919 are shown in the ion:

	Pennsylvania.		New York.		Massachusetts.		All other States.		United States.

Connecticut, and Wisconsin.
and Connecticut, and mills in Pennsylvania and New York, where 1,099 looms than carpets and rugs.

te of advance has been peculiar. The value produced by each operative has average of $1,176 just before the Civil War, it had become only $665 in 1890. By t had reached $857; which itself was a decline from the 1909 figure of $950, but by

In respect to the scale on which production is conducted, the peculiar position of Pennsylvania, and to a less extent New Jersey, is evident. While the former State possessed practically two-thirds of the total number of establishments, it held less than a third of the total number of employees, and only a little more than 40 per cent of the looms. Indeed, Pennsylvania is and has always been the home of the small producer and of the concern which devotes itself to carpet weaving alone. The fact that many of the concerns in New York, Massachusetts, and Connecticut maintain their own wool-spinning departments explains for the most part the particularly large proportion of total wage earners in those States, as compared, for example, with their ratios of looms.

The distribution of the carpet manufacture in 1914 and 1919 according to the several branches of the industry is presented in the following table, showing the number of looms of the various types contained in the five States above mentioned:

TABLE 4.—*Number of looms in the domestic carpet and rug industry: 1919 and 1914.*[1]

[1] Excludes Colonial or rag carpet and rug looms.

It will be noted that, taking the aggregate number of looms of each type, the manufacture of ingrain was largely localized in Pennsylvania, as indeed it has always been particularly concentrated; again, that the proportion of Axminster looms was especially high in New York State; that the manufacture of tapestry and velvet was for the most part monopolized by Pennsylvania and New York, these two States operating 82 per cent of all such looms in 1914 and 87 per cent in 1919; while the production of Brussels and Wilton was somewhat more scattered, approximately two-thirds of these looms being located in Massachusetts and Pennsylvania, and the rest divided among New York, Connecticut, and New Jersey. Of rug looms alone, the concentration was different in certain respects. In 1914 the proportion of these wide looms of the Axminster type located in New York was even higher than the proportion of all Axminster looms so located, around 75 per cent instead of 60 per cent, but with the increase in the number of wide looms in other

914 and 1919, particularly in Pennsylvania and York's ratio stood in 1919 at only 57 per cent for ast 68 per cent for all looms. Again, the tapestry oms of New York State formed a particularly great such looms—in 1914, over two-thirds of the total ast 36 per cent of all looms; in 1919, over half of the s against 38 per cent of all looms. On the other ia's tapestry and velvet looms were predominantly arpet variety, her looms comprising 61 per cent in cent in 1919 of all machines in that branch of the rug looms formed only 20 per cent of the total in ent in 1919. In the Brussels and Wilton manufac- ly exclusive possession of wide looms was a feature t the striking increase in the number of wide looms and Connecticut during the war period is also note-

trend away from the peculiarly great centralization ustry in and about Philadelphia which marked the entury ago. Even in the 15 years covered by the id 1914, the movement is evident. In the former ia is reported to have supplied 56.3 per cent of the ion, calculated on the basis of quantity, and 44 per asis of value. In 1914, the corresponding per- 3.3 and 33.4 In 1919, the figures were 33.3 per r cent, respectively. On the other hand, Massa- rk, and "all other States," of which Connecticut is ant, have enhanced their shares appreciably. On ity the output of New York mills increased between om 28.5 per cent to 36.2 per cent of the total; that from 9.6 to 12.4 and that of mills in all other states). In other words, while the industry shows no e away from the group of states in which it has ed, the portion which each shall contain has been cation.

Moreover, there is a certain veness in the Philadelphia mills, which, quite apart e size, is an obstacle to their successful competition ade. They suffer to a material extent from the fact ndustry went through its early development in that esult, mills are not well arranged, buildings are old, must be carried on under serious obstacles to effi- phase is spoken of by a trade paper of the wool connection with a discussion of the Philadelphia : "The whole trouble with the ingrain business is

the fact that manufacturers of ingrains (who, as has been pointed out, have been largely confined to the Philadelphia district), are slow to see a change in the desires of consumers, did nothing to counteract that change, but went ahead manufacturing ingrains, while the people were being educated to the use of higher-cost carpets and, on the other hand, rugs and straw mattings."[10] More recently, the manufacturers of ingrains have turned to the production of wool and fiber (paper) fabrics, although they there come into competition with strong companies which developed that type of floor covering.

(c) QUANTITY AND CHARACTER OF THE DOMESTIC PRODUCTION.

1. *Quantity of production.*[11]—The domestic production of carpets since 1899 is presented in the following table compiled from census returns:

TABLE 5.—*Aggregate production of all types of carpeting.*

	1919	1914	1909	1904	1899
Square yards	52,181,512	66,340,274	81,218,881	82,670,843	76,410,050
Value	$110,151,089	$64,683,322	$66,966,338	$56,861,775	$43,579,682

These statistics give evidence of the comparatively slow growth of the industry since 1890. The apparent decrease for 1914 does not signify an actual decline in productive capacity. A number of causes contributed to the reduction of output for that particular year. Among them should be noted the uncertainty and indecision in the carpet industry itself arising from the change in the tariff on carpetings which went into effect January 1, 1914; a general depression in business; and the disturbance of economic conditions following the outbreak of the European war. Unsettled conditions in the carpet industry and a conservative policy were the effect not of actual importations of carpet goods, which were not particularly great, but rather the fear of them. Manufacturers wished to feel out the new situation in which the new tariff was a factor of importance. Under more favorable general economic and business conditions it is probable that the change in the tariff would have seemed of less consequence. The further decline in output in 1919 was in large part the result of curtailment of consumption resulting from war conditions, and the low figure in 1921 is due both to depression and a strike in certain branches of the industry.

The statistics also show that although production has been almost stationary, values have mounted materially since 1899. The increase in the value per square yard has been rapid and persistent, from 63 cents in 1899 to 97 cents in 1914.[12] In part this advance has been due to a decline in the value of the dollar; but in greater measure it may be traced to changes in the character of carpet production.

Statistics of production appearing in the census of war commodities, 1918, show decreased production during war years. Converted into square yards, the production for the years 1915, 1916, and 1917,

[10] American Reporter, May 8, 1913, p. 594.
[11] See Appendix B, p. 126.
[12] The advance to $2.11 per square yard in 1919 was, of course, due in large part to war conditions, and the average of $1.88 represents a partial survival of those conditions.

in this census, was as follows: 51,425,085 square square yards, and 45,076,556 square yards, re- figures may be slightly inaccurate, since some uded in the process of converting the figures from ich the production is given in the census to the but they appear to be reasonably plausible in the uent figures of the 1919 census.

roduction among types of carpeting.—The division oduction among carpetings of the several types, production since 1899, appear in the following es.[13]

[2] are based on the statistics presented in the war census of 1918. It is believed are not in material error. At best, however, the statistics contained in this in them, should be used with caution.

hat in recent years, on the basis of quantity, Axmin- uted around one-quarter of the total domestic pro- s (tapestry Brussels), from one-fifth to one-fourth; velvet), from one-eighth to one-fifth; Wiltons, about iat among the remainder the wool and paper fiber ingrain weave) has been a newcomer of increasing the basis of value, however, the ratios are changed

[13] See Appendix B.

some particulars, especially in that Axminsters play an ev
smaller part in the total value than in total yardage; that bo
Wilton exceeded in value of product the tapestr
and turned them in the basis of quantity; and that t
and velvet-chenille productions appear much less importa
in point of view of value than from that of yardage, registeri
for example, only 5 per cent together for value as compar
per cent in quantity.

The most striking and in some ways most significant change is t
in the proportion of the total output represented by ingrai
At the present time there is practically no manufacture of a
ingrain and very limited quantities of ingrains in which t
are used for warp yarns. The looms have either been scrapp
and are now taken up on tapestry or Axminster looms or they ha
been turned to the production of substitute and cheaper forms
of floor coverings such as wool and fiber goods. The narrow ingra
looms reported in existence in 1919, a large proportion of whi
were undoubtedly engaged on these substitute fabrics, were less tha
one-seventh of the number in use 20 years before, and the numb
of looms had decreased about one-eighth from the high poi
reached in 1904.

Causes of this decline are not hard to find. The trend of a lar
part of the domestic market has been toward a more luxurious ty
of floor covering, especially a plush-pile fabric, and competitio
has been intensified by the gradual reduction in the cost of man
of these pile fabrics, such as Axminster and velvet. Furthe
competition has increased in strength from a class of goo
other than ingrain, especially straw matting, wool and fib
fiber rugs and grass rugs. Subjected to pressure from either sid
many mills have often abandoned the field. As early as 19
looms which had cost $600 were reported to be selling for
Among the causes may be mentioned also the disadvantage arisi
from the small size of the usual ingrain mill and the unprogressivene
of many ingrain manufacturers.

A similar decline in production took place in Smyr
rugs. In annual yardage the production had fallen by 1914,
to a quarter of the figure for 1899 or 1904. The reaction shown
for 1917 is believed to be more apparent than real, arisi
from the fact that production was reported in linear yards, of whi
fewer square yards contain. It seems probable that at best the Smyr
industry did not grow during the period 1914 to 1917, a probabili
not clearly brought out by the 1919 census, which shows prac
no change whatever since 1914 in the production of Smyrnas. As late
as 1919, only three or four mills in the country were making Smyrna
rugs on power looms, at least the majority of the looms were report
as being hand looms. Moreover, the manufacture has shrunken

ɪber of Smyrna power looms, expressed in index numbers, with 1899 as a base, g schedule:

	1899	1904	1909	1914	1918	1919
.....	100	83.3	70.9	35.8	69.4	17.9

ɜis due, it is believed, to the reporting of machines actually in existence, whereas ooms actually in use. In addition to the decline in power looms, there was a ɪd looms, from 955 machines in 1899 to 11 in 1914.

n the number of power looms, reduced to index numbers with 1899 as a base, ther than ingrain and Smyrna is herewith presented:

	1899	1904	1909	1914	1918	1919
.....	100	100.9	116.9	101.1	81.2	70.6
.....				71.3	65.4	109.3
.....	100	135.8	146.1	69.8	85.1	67.4
.....	100	188.3	336.7	358.7	319.0	281.8
.....	100	131.2	192.4	287.5	326.5	212.6

ɪ by these figures, however, is somewhat erroneous in the case of the Axminster elvet looms, since there has been a large introduction of wide looms in these

ɪ

3. *Division of production among forms of carpeting.*—The proportions among the three forms of carpeting, as shown in the censuses of 1914 and 1919, are given below:

TABLE 7.—*Relative production of carpets or roll goods, seamed rugs, and seamless rugs in the domestic industry, 1919 and 1914.*

Type of carpeting.	1919			1914		
	Carpets or roll goods.	Seamed rug.	Seamless rug.	Carpets or roll goods.	Seamed rug.	Seamless rug.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
Wilton	24.73	59.52	15.75	33.9	63.6	2.5
Brussels	16.46	82.40	1.14	25.7	74.1	.2
Velvet	44.36	13.10	42.54	36.7	22.0	41.3
Tapestry	20.01	1.17	78.82	19.2	20.0	60.8
Axminster	13.77	49.04	37.19	9.2	61.2	29.6
Smyrna	.....	.....	100.00	.....	.....	100.0
Chenille Axminster[1]	.....	.....	100.00	.....	.....	100.0
Ingrain	59.38	.....	40.62	64.6	.....	35.4
Wool and fiber[1]	.....	.....	100.00	.....	.....	100.0
All types	23.06	24.04	52.90	26.1	31.4	42.5

[1] The above statistics, drawn from the census of 1914, are erroneous in at least two respects. The chenille Axminster manufacture is by no means limited to seamless rugs. A large portion of its output, and perhaps a quantity superior in yardage to that in the seamless rug form, is produced in rolls of goods usually 9 or 12 feet wide, and of a single color. Again, the wool and fiber production is also not wholly of seamless rugs. A portion of the output is in the form of roll goods, although here normally but a yard wide

Nearly three-quarters of the domestic production is in the form of rugs. Only in the ingrain (which embraces some wool and fiber) production does the old carpet retain any substantial place. Likewise, the new position of the seamless rug is apparent. The production of approximately 37 per cent of the Axminster goods in this form is extraordinary, when one considers the relative novelty of the wide Axminster machine; while the magnitude of the proportions in the velvet and tapestry manufactures and the increase shown in 1919 in the case of the Wiltons are both remarkable.

The future of roll goods is obscure. There is seemingly a certain limited demand for carpeting in this form which will not wholly disappear, as, for example, the requirements of the automobile trade. Yet hardwood floors are becoming more prevalent, and it may well be that the scale of the roll goods production will suffer further curtailment.

Of the rugs, the feeling quite generally in the marketing branch of the industry is that the seamless fabric will grow steadily in favor. However, there are deterrents to such a movement, as, for example, hesitancy on the part of manufacturers to scrap their narrow looms, and in the Wilton and Brussels trades a lack of adequate equipment. Seemingly the change will be gradual but constant in the direction of the seamless goods.

4. *Quality of domestic production.*—Quality in rugs and carpets is mainly a matter of frames, wires, and ends, which form the construction of the fabric, and is not determined to a great extent by the quality of the constituent yarns, which plays so important a part in woolen and worsted cloths. Fineness of fabrics, that is, a high number of the constituent elements above mentioned—means, in general, superior goods in appearance and durability, because of the greater compactness of the texture.

great diversity of the grades manufactured, com-
and American products can be drawn only in
average product. It may be said that, on the
products of the Brussels and Wilton, tapestry,
re more often woven of lower pitch and wire than
ision is made in the British wage scale for pro-
seven frame fabrics, while American production
, but almost always confined to five-frame goods.
insters the American products are substantially
in quality; the manufacture of such goods in the
ists almost wholly of wool-backed goods, whereas
substantial proportion of the production is made
fabrics.

HISTORY OF INDUSTRY SINCE 1913.

rug industry has undergone many vicissitudes in
some extent these are shown in the accompanying
the percentage of active carpet and rug looms
riod. For purposes of comparison, lines are intro-
art, showing the percentage of active looms in the
tion.[17]
l that there have been three periods of particular
The first one, which covers the greater part of
1914, is attributable to the general depression
whole country, to the particular uncertainties in
ig industry itself, and to the conditions brought
break of the European war. It will be observed
, and more particularly in 1916, conditions became
rmal and so continued until the outbreak of hos-
ie United States and the Central Powers.
riod of extraordinary inactivity in the industry,
m the latter part of 1917 until the beginning of
up with the general control of industry by the
ment. During the war the carpet and rug industry
the War Industries Board as nonessential, and in
able to secure but relatively small supplies of wool
ssary materials, while its labor force was cut down
en for the service. However, the effects incidental
n of the war were nearly, if not quite, as great as
ributable to governmental action. By the control
lies of carpet wools were seriously curtailed; and in
upplies of jute and linen yarns which are imported
raw materials are imported. Again, such yarns,
uired for war purposes, were not readily or abun-
for carpet manufacture. Perhaps more important
n of labor from the carpet and rug mills to the
ustries. In this relation the factories of the carpet
ture were unhappily situated. Many of them, such
id around Philadelphia and New York, were in or
where great demand was made for war workers. In
as Thompsonville, Conn., and Amsterdam, N. Y.,

[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

This comparison does not present the complete picture. In the case of the woolen, worsted, and cotton goods manufacture, the majority of the concerns and, in the particular case of the woolen manufacture, nearly all the concerns are integrated plants, containing a full complement of operations for working the raw material up to the finished product. In the carpet industry, on the other hand, the usual carpet mill is dependent upon other concerns for much of the

1 "Pitch," it will be recalled, refers to the number of wool-warp ends in a breadth of 27 inches; and "wires" to the number of wires (inserted to form loops) per inch of running goods.

lls. 92.2 per cen
and 37.6 per cen

then, are peculiarly devoted to the weaving and finishing processes. In the establishments from which the Tariff Commission secured figures, the proportion of operatives thus engaged, including the workers in the operations intermediate between spinning and weaving was 77.6 per cent. Again, it may be noted that the average number of such operatives per establishment was 465 as compared with the 323 given in Table 8 and covering all operatives in the mills.

The Tariff Commission also obtained original data upon the spinning of yarns by carpet mills for consumption in their own carpet production. Eleven mills reported the manufacture of woolen yarns for their own consumption and seven stated that their requirements for such yarns were covered or practically covered thereby. Eight mills indicated the manufacture of worsted yarns; seven of these produced all the yarns of this variety that they consumed. Only one mill reported the spinning of cotton yarns; and none the production of jute or linen yarns. The total number of spindles contained in the establishments from which the commission secured returns was: Woolen, 82,616; worsted, 82,224.

Incidentally, it may be noted that the advantages resulting from the possession of individual spinning facilities are not particularly great in carpet manufacture.

In the case of woolen spinning, the chief advantage is the possibility of supervising directly the mixing of the various materials (such as new wool, noils, and wastes, recovered wool fiber, and animal hair) which may be used in the manufacture of such yarns. But in the production of carpet yarns, the proportion of such substitute materials employed is much less than in the manufacture of woolen cloths. The census figures of 1914 were 15 per cent for the former industry and 70 per cent for the latter.[22] The reason for so wide a variation is to be found in the marked distinction between the use of such yarns for cloth and for carpet manufacture. There is no opportunity in the latter industry for the soft, weak yarn such as may be used in blanket manufacture; nor is the support supplied to such yarns in the operations of the carpet industry subsequent to spinning at all comparable with that provided in the fulling process of woolen cloth production. The gain to the carpet manufacturer arising through the direct supervision of his own mixture of materials lies principally in the blending of different kinds of new wools, judiciously selected from those available in the market at a relatively cheap price, so as to obtain a yarn of a given strength and appearance.[23]

[22] Cotton consumed has been included as a substitute material in the woolen goods figure, but not in that for carpets. In the former, union yarns (those composed of a mixture of wool and cotton fibers) are quite common, but are nearly unknown in the latter. In the worsted goods manufacture, on the other hand, the proportion of substitute materials used was less than 5 per cent in 1914.

[23] It may be noted that the limited statistics available indicate some slight trend toward woolen spinning in the carpet industry, and away from worsted and cotton spinning. A comparison is possible only with respect to the five-year period, 1909 to 1914. Corresponding data were not reported to the Census in 1919 nor prior to 1909. The percentages of woolen, worsted, and cotton yarns purchased by carpet mills as compared with their total consumption of such yarns are as follows:

	1909	1914	1919
Woolen yarns	40.9	37.8	38.2
Worsted yarns	44.5	47.5	42.6
Cotton yarns	89.6	92.2	92.6

The number of worsted combing machines in the carpet manufacture also shows a considerable decline over the period 1899 to 1919, from 134 to 85.

mportant features, not of a technical character, favorable to
ıming of yarns within the carpet mill are the saving of
diate profits, and the assurance of supplies at all times.
mer, however, in the view of some carpet manufacturers
egrated plants is of somewhat doubtful advantage. The
substantial when wool yarns are scarce and prices high; but
iod of depression the carpet mills must keep their spinning
ents in operation to avoid loss when, often, they could pur-
ns in the market at advantageous prices. It is questionable,
whether many manufacturers so situated really appreciate
cial gain or loss in more than a general way, since their
ıg methods are often inadequate to represent either clearly.
hole, the controlling reasons seem to be the independence of
lls in the matter of supplies as and when needed, and the
ntioned advantages of a technical character.

view of the position of the carpet industry in respect to
production is shown by the distribution of plants accord-
number of wage earners. Corresponding figures for other
ustries are presented for purposes of comparison:

istribution of establishments according to the number of wage earners, 1914.

s in New Jersey, 1 in Connecticut, and 1 in Wisconsin, in 1919. Three establish-
nd 1 in Indiana, in 1914.

) GROWTH IN SIZE OF ESTABLISHMENTS.

the carpet industry has been steadily in the direction
ishments, together with a decrease in the total num-

ber of establishments. This is obvious from the census figures covering the period since 1869:

TABLE 11.—*Growth in the average size of establishments, 1869–1919.*

Year.	Number of establishments.	Average number of wage earners.	Average capital.	Average value added by manufacture
1869	215	56	$58,229	$20,0
1879	195	104	110,095	45,0
1899	173	166	220,960	110,0
1909	133	214	334,205	157,0
1909	139	240	544,079	227,0
1914	97	323	877,874	270,0
1919	73	306	1,589,286	740,0

The growth in average size of establishment thus pictured seems to be due almost wholly to an extension of the carpet-weaving and finishing facilities only, with no more than proportionate expansion in the spinning or other preparatory processes. It has not arisen from the addition of these latter functions without extension of the manufacturing capacity of the plants in terms of finished products. As far as may be ascertained there has been no material change in the extent of integration within the industry during the last 20 or 30 years.

Another point to be noted in the above statistics is the extraordinarily great increase in the average capital invested per establishment. Even before the war this had increased almost fifteenfold, whereas the increase in the number of wage earners had been less than sixfold and in the value added by manufacture approximately sevenfold. This increase in capital investment, which has been particularly rapid since 1899, is usually attributed to the necessity of scrapping of much of the old equipment and the purchase of more expensive new machines consequent upon the increased demand for wide, seamless rugs. Undoubtedly this has been a material factor, but a more important one is the radical transformation in the nature of the industry whereby the bulk of the manufacture has shifted from ingrains to the more expensive Axminster, Wilton, tapestry, and velvet. The plant and equipment for the production of these latter types are far more costly than for ingrain.

ADVANTAGES OF LARGE-SCALE OPERATION.

The advantages of large-scale operation in the carpet industry do not differ in some respects from advantages of the same sort in other manufacturing enterprises, but attention may be drawn only to those features of carpet manufacture which give large-scale production especially favorable opportunity.

In carpet manufacture as in many branches of the textile industry, the element of design is of peculiar importance. The effects to be secured from the various types and styles of rugs and carpets available for use are the product of the ingenuity and resources of the designing staff, great or small, which is employed. To make full use of the possibilities in this direction, the artistic department of the concern must be large, competent, and well paid, and the maintenance of such a force [illegible] which is out of the

oncern.[24] Again, the diversity of style required to please all of trade calls for a wide latitude in the variety of goods produced. ersity of production to satisfy differing demands is so great ly a large establishment can attempt it, and a small plant is pped by the lack of it. Finally, as to form and size of floor g, it may be noted that opportunities often occur for the on in both carpet and rug of a single motif, if the mill is d for the production of both forms. As regards rugs alone, it ary that a series of sizes from 10 feet 6 inches by 13 feet down t 2 feet 6 inches by 5 feet should be all of the same general To effect this, the design, usually plotted for a fabric 9 by 12, ed in its motif to the variant sizes, for obviously the intri- res which would be perfectly suitable for a large rug could not produced and if produced would be wasted on a small mat. uch as these of course are to the advantage of the large mill. manufacture is peculiar in the extent to which the mills ndent upon other manufactures for semimanufactured , particularly materials such as linen and jute yarns in market is wholly or largely unorganized. In consequence purchaser is bound to secure advantages through conces- rice, through prompt deliveries, or otherwise, all of which to economy of production. The saving in intermediate y contribute to the financial benefit of the large, integrated directly or through the assurance of adequate supplies in arcity.

in relations the nature of the processes in carpet manu- ors the large-scale producer. In the tapestry and velvet f the industry the peculiar method of imparting the design, ugh drum printing or cylinder printing, requires the pro- a considerable number of rugs upon a single design to be On account of the relatively large labor cost in drum e manufacture of a number of rugs at a single operation o the advantage of distributing preliminary costs over an ea. From the chenille Axminster manufacture, too, an be drawn, though from the British industry. Through mestic and foreign demand for their chenille rugs, one ish manufacturer of such goods is able to prepare in ad- quantities of chenille "fur" suitable for a selected line the various sizes. As the orders come in, the appro- is taken from the storeroom and only the "setting" g has to be carried through. Since the preparation of an important and expensive portion of the chenille especially for fabrics of advanced design, the pro- in bulk gives special advantage. American producers, f the limited demand for such goods in this country, able as yet to adopt such a method of large-scale

expense to the former, although to the latter the expense is not a substantial factor since it is spread over a larger number of sales.

SECTION 5. MARKETING METHODS.

(A) ORGANIZATION OF THE TRADE.

One of the distinctive characteristics of the carpet trade is the degree to which the practice of direct selling prevails. Approximately one-half of the domestic mills maintain offices in the chief marketing center, New York City, and several also maintain offices in Chicago, Boston, or other large distributing points. This group includes many of the largest manufacturing concerns of the country. Other mills sell through special selling agents. While this latter group is much less extensive, it embraces several important manufacturing firms. In some cases this type of agency has partial or complete ownership of the mill.

A third group of mills, composed almost exclusively of the smaller concerns of the country, market their production direct from the mill, generally to wholesale houses with offices located in the chief distributing centers, such as New York City. Some of these firms, however, sell a large portion or the whole of their output to catalogue houses or department stores. It sometimes happens that such a house has control of the manufacturing establishment. For the most part the type of rug for which considerable sale still continues through such houses is the ingrain carpet and art squares, the product largely of small manufacturing plants.

From the selling offices of the various mills or from the selling agencies of others, the goods are distributed either directly to large department stores or through jobbers to retailers of lesser size. The direct purchase by department stores and large house-furnishing stores is a feature of the trade which has developed largely in the last 15 or 20 years. In consequence, the scope of the jobber has been appreciably lessened.

The method of sale in the carpet trade has for many years been that of seasonal openings. The large distributors hold openings twice a year, when they announce the prices for the succeeding season. Before the war such openings were held in May and November; and, though in recent years they have been moved forward to April and October, there seems to be a tendency to return to the old practice. The openings which take place in April or May pertain to the sales in the retail trade of the succeeding fall and winter, and those of October or November to the retail trading of the following spring.

The retail trade shows marked seasonal fluctuations. Changes of residence, movings of families from house to house, general housecleanings are a chief occasion of demand in the trade, since people are then most likely to purchase new carpetings, and these usually occur in the spring or fall, rather than in winter or summer. However, there is a certain amount of purchasing at all seasons for replacement, for the equipment of new houses, or for other reasons, and this prevents such severe seasonal fluctuations as occur in some other textile trades.

(B) TERMS OF PAYMENT.

tice had established certain arbitrary datings from ayments. Thus deliveries of goods sold in the f March 1 of the following year, and a discount of for payment within 10 days thereafter. For fab- ng datings were as of September 1, with a similar cently, however, this practice has changed. With manufacturers now date their bills as of 60 days tual shipment, and a 4 per cent discount is allowed within 10 days thereafter.

BOR CONDITIONS IN THE DOMESTIC INDUSTRY.

CHARACTER OF LABOR EMPLOYED.[25]

employees in the carpet and rug manufacture, nd age, is given in the following tabulation, which rison with other textile manufactures:

m of wage earners in carpet and rug industry, as compared with other textile industries, 1919 and 1914.

	1919			1914		
	16 years and over.		Under 16 years of age.	16 years and over.		Under 16 years of age.
	Male.	Female.		Male.	Female.	
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
.....	61.4	36.1	2.5	57.7	40.2	2.1
.....	66.2	32.3	1.5	66.4	31.9	1.7
.....	47.2	47.2	5.6	48.2	46.9	4.9
.....	27.8	66.8	5.4	27.8	66.2	6.0
.....	55.3	39.9	4.8	53.4	38.2	8.4
.....	38.0	56.7	5.3	38.5	54.3	7.2

of female labor in the carpet and rug industry is worsted, knit goods, or silk industries; it is roughly the cotton goods production, and is greater than oods industry. The figures upon which the pro- d as regards the carpet and rug manufacture cover cture in carpet mills; that is, they include employees y and spinning processes as well as in the weaving cesses.

ration of the employees into the several industrial as a result of inquiries made by the Tariff Com- paration for 32 concerns reporting is as follows:

ivision of carpet-mill employees into manufacturing groups.

Department.	16 years and over.		Under 16 years of age.	Total.
	Male.	Female.		
.....	2,258	1,971	73	4,302
.....	4,607	2,725	162	7,494
.....	3,665	1,439	23	5,127
.....	1,190	1,046	22	2,258
.....	11,720	7,181	280	19,181

12.

From this tabulation, and from the earlier enumeration contained in the census of 1910, it appears that while the proportions with respect to the whole body of employees do not greatly differ from the proportions given in the census figures, the divisions group by group vary considerably. Female labor is confined generally to a certain group of operations; in the preparatory processes pickers, worsted spinners, and doublers are largely women; in the intermediate processes drawers-in, winders, and setters; and in the finishing departments sewers and burlers. A substantial portion of those employed in the weaving department are likewise women. On the other hand, the ratio of men is particularly great in woolen spinning, creelers, dyers, and printers are largely men; so also are weavers, and in the finishing operations shearers, finishers, and packers. In all classes of indirect and general workers males predominate. That the proportion of women is not greater, especially in the finishing operations, is due to the weight and bulk of the completed goods.

In the weaving department, the ratio of men to women is subject to important variation among the several types of weaving, as shown in the following tabulation from typical mills:

TABLE 14.—*Division of weavers on the several types of carpeting.*

Type of carpet.	16 years and over.		Under 16 years of age.	Total.
	Male.	Female.		
Brussels and Wilton	1,045	194	5	1,244
Tapestry and velvet	1,017	59	.....	1,076
Axminster	611	384	17	1,012
Chenille Axminster	248	83	.....	331
Smyrna	66	.....	.....	66
Ingrain	39	13	.....	52
Other	5	10	.....	15
All types	3,031	943	22	3,996

The proportion of women in the Axminster and chenille Axminster weaving is particularly great, forming in the first almost half of the employees so engaged. In the Brussels and Wilton and in the tapestry and velvet weaving, on the other hand, their employment is limited. Many concerns have no women at all working on these types of looms, and the proportion given above, especially in the case of Wilton and Brussels weavers, is due to the particularly high proportion of women thus employed in two or three of the larger mills.

In the statistics obtained by the Tariff Commission as well as in the census returns, the proportion of children to total employees is lower than in any other textile industry with the exception of the woolen-goods manufacture. The employment of children is confined almost wholly to the preparatory, spinning, and intermediate processes, and in these usually only as helpers.

(B) HOURS AND WAGES.

The number of hours of work in the mills has been substantially reduced in the last few years. As late as 1914, the census reported that approximately 74 per cent of the operatives were working 54 hours per week, and 15 per cent additional 54 to 60 hours or more

, mills have generally adopted the 48-hour sched-
ing only 44 hours. A few mills, especially in
strict, are still working 50 hours, occasionally 54

ıe various stages of carpet manufacture, especially

[1] Crompton loom.

In general, the weaving of rugs is paid more highly than is the weaving of carpets of comparable grades. The rate for chenille Axminster is far in advance of that for any other kind of carpeting; Wilton and Brussels follow, in order; then tapestry and velvet, with very little difference, and Axminster with the lowest rate for the coarser structure, but with rates for the finest structure apparently exceeding those for the best grades of tapestry and velvet. The effect of 2-loom weaving is conspicuous for Axminster; less so for tapestry weaving.

A few firms reported ingrain rates, though not in a form to permit their inclusion in the table; they range from 8½ to 27½ cents per linear yard.

SECTION 7. DOMESTIC EXPORTATION.[28]

The exportation of carpets and rugs from the United States has never been an important feature of the domestic carpet trade. The highest point reached by the export movement was in 1896, when nearly 330,000 linear yards were sent out of the country; but as the total domestic production was about 76,000,000 square yards the exportation was of no great significance from a quantitative standpoint. There are, however, certain features of some interest in the trade, particularly its spasmodic character.

The figures of total exports show no extraordinary irregularity from 1880 to 1910; but to any one country the movement appears sporadic. Exports to the United Kingdom are typical. In the period 1880 to 1893 domestic shipments averaged approximately [illegible] running yards; but in 1894 they jumped to 265,000 yards, and in the five years 1894–1898, inclusive, averaged nearly 200,000 yards. Thereafter they fell rapidly. In the succeeding 5-year period they averaged less than 36,000 yards annually, and in the last 5-year period for which statistics are available to less than 11,000 yards. The sudden advance in 1894 was occasioned by the depression in American business conditions. The exports were largely confined to Axminster goods. During the war American producers were able to obtain some trade which had previously gone to the United Kingdom

[28] See appendix E, p. 39.

he Continent, but it was not large and was broken off in 1918, ecause of conditions since that time in the domestic industry, it t been since expanded. Data collected by the Tariff Commission hat few firms sent carpetings to foreign markets during 1919.

SECTION 8. IMPORTATIONS OF WOOL CARPETS.[27]

(A) SOURCES OF IMPORTATION.

r to the war.—The following table shows the average imports by ies during the period 1910–1914, inclusive:

TABLE 16.—*General imports of wool carpets and rugs—Average 1910–1914.*

Country.	Quantity.		Value.	
	Square yards.	Per cent of total.	Amount.	Per cent of total.
.....	428,562	41.1	$2,037,643	47.2
.....	305,149	29.3	1,218,255	28.2
East Indies.....	34,277	3.3	93,181	2.2
.....	35,529	3.4	121,007	2.8
.....	5,914	.6	27,339	.6
Kingdom.....	149,712	14.4	448,298	10.4
.....	19,512	1.9	71,656	1.7
.....	22,661	2.2	118,359	2.7
.....	40,739	3.8	183,962	4.2
tal.....	1,042,055	100.0	4,319,720	100.0

large import from oriental countries is clearly shown in this During the five years Turkey, Persia, the British East s, Russia, and China sent 77.7 per cent in quantity and 81 per in value. These imports are handmade fabrics. So likewise me from France and other countries. Altogether imports of nade products were approximately 84 per cent of the quantity 8 per cent of the value of the total imports. Most of the im- from the United Kingdom and Germany were machine-made, comprised approximately 16 per cent of the total quantity ted and 12 per cent of its value.[28]

ring the war and post-war periods.—The figures for 1915 and ing years show the dislocation of imports during the war l. There was no falling off during the first year of the war—scal year 1915—and the cause was undoubtedly the reduction

[27] Appendix G, p. 139.

[28] average value per square yard of the imports from the several countries during the period 1910–1914 llows:

.....	$4.75	Germany.....	$3.67
.....	3.99	France.....	5.22
East Indies.....	2.72	All other.....	4.52
.....	3.41		
.....	4.62	Average.....	4.15
Kingdom.....	2.99		

be noted that the square-yard value of the importations from the United Kingdom and Germany erally lower than that from the other countries, the exception being the British East Indies and The peculiar position of these latter countries is due to the fact that the handmade products rom India and the Mongolian part of Russia are distinctly the poorest types imported into the States. In consequence, their average value is lower or not much in excess of that of the machine- icles—these being, in fact, high-grade machine products—from England and Germany.

in duties effected by the tariff of 1913.[a] The reduction of imports in 1916 amounted to some 31 per cent, while in 1917 imports were only slightly less than in 1915. In 1918 they were only about 6 per cent of the average for the five years 1910–1914, and by 1919 they had become approximately 25 per cent. Shipments in both 1920 and 1921, however, exceeded in amount those in any year preceding the outbreak of the war, with the exception of 1910, and in value were the highest recorded—in 1920, 1,002,812 square yards, valued at $7,208,407; in 1921, 1,384,388 square yards, valued at $8,867,218. Changes have also occurred in the sources of imports. Imports from Turkey (the leading pre-war source) were in 1920 and 1921 less than half the pre-war average. Those from France (also a minor source) were higher in 1920, but in 1921 lower than before the war. On the other hand, imports from the United Kingdom increased in 1920 and 1921 to the high level of the period 1915–1917 and were roughly three times the pre-war average; those from Persia exceeded the pre-war average by a considerable margin; while in the case of China and British East Indies, particularly China, the increases in imports were very striking. China has now become a major source; in part this may be attributed to the lack of competition from the Near Eastern countries during and, to a less extent, since the war, and to the sudden popularity which has marked the trade in Chinese rugs during the last few years.

(B) THE TYPE OF RUGS IMPORTED.

Prior to the war.—The average of imports by types during the period 1910–1914 is given in the following table:

TABLE 17.—*Imports of wool carpets and rugs for consumption—Average, 1910–1914.*

Type.[1]	Quantity.		Value.	
	Square yards.	Per cent of total.	Amount.	Per cent of total.
Carpets woven whole for rooms	895,424	86.55	$4,069,162	94.52
Aubusson, Axminster, moquette, and chenille	27,385	2.65	66,069	1.53
Saxony, Wilton, etc.	18,949	1.83	38,369	.89
Tapestry Brussels	1,988	.19	1,598	.04
Velvet	31,364	3.03	62,158	1.44
Brussels	4,645	.45	5,994	.14

Not specially provided for	22,408	2.17	34,547	.81
Total	1,034,620	100.00	4,305,149	100.00

[1] Felt carpets omitted from this and the following table.

The terms under which the various types of carpeting are entered in this table have been established by court interpretation of the

[a] For Schedule K these rates went into force on Jan. 1, 1914. The figures of imports for consumption indicate the immediate effect of the reduced duties. In the calendar year 1913, 828,029 yards, valued at $1,720,248, were brought in. For the following year imports were 66 per cent greater in amount, 39 per cent greater in value. This fluctuation in amount is larger than any preceding fluctuation shown by the fiscal-year figures since 1891. Relatively greater fluctuations in value have, however, occurred. Average imports for the following three years were approximately equal to those of 1913; 1918 and 1919 were years of extremely small imports, especially so during the fiscal year 1919, when only 267,006 square yards were brought in. The two following quarters show some recovery, and in the first quarter of 1920 imports were greater in amount than in any quarter following that ending Mar. 31, 1914, and over 55 per cent greater than that quarter in value.

ıe tariff acts.[30] *Carpets* are entered as Axminster, , etc., according to the various types. Machine- types, except Axminster and chenille Axminster, ı the roll goods of these several varieties, under the assifications. Machine-made Axminster and che- *rugs* fall within the classification "carpets woven ' given above. All handmade *rugs* enter under this n other words, the classification "carpets woven s" includes oriental fabrics, which form by far the f it, European (and other) handmade rugs, and a cer- European (machine-made) goods of the type men- cond classification, "Aubusson, Axminster, moquette, covers only *carpets* of these types. The other classifi- both carpets and rugs. There is thus no clear divi- e between handmade and machine-made products.

ar and post-war periods.—The following table presents or the seven years 1915–1921:

ports of wool carpets and rugs for consumption—average 1915–1921.

Type.[1]	Quantity.		Value.

mitted.

ures indicate the result of lowered duties and war condi- e total yardage imported was about 85 per cent of that of ing period; the value about 98 per cent. More striking decrease is the change in the character of the goods. The as occurred in the machine-made products. Four standard ussels, Wilton, tapestry, and velvet, formed 20½ instead of ıt of the yardage brought in, and 8⅘ instead of 2½ per cent ue. There has been an absolute increase for all of these ept velvets, and for Aubusson and Axminster carpets the was accompanied by a decrease in rugs of the first class— iental—of somewhat less than two-fifths.

ges for this period, during which year to year fluctuations reme, do not adequately portray the facts. The decrease ts under the first classification took the form of an immediate 1915—during this and the following five years imports never l 650,000 square yards, the lowest figure since 1908—and a arked decline in 1918 and 1919, the latter year showing im-

definition of the terms "rug" and "carpet," as used in this report, see p. 29. Statements nly to statistical classification.

ports of less than 300,000 square yards. These were largely handmade goods of oriental origin. Coincident with an increase in total imports even beyond the pre-war average, oriental rugs have continued to predominate among the imports since 1919.

The four standard machine-made types, Brussels, Wilton, velvet, and tapestry, all show a strong upward movement in 1915, despite war conditions. The years 1916 and 1917 show importations well above the pre-war average, though less than the high point reached in 1915. The decreases during 1918 and 1919 are great, the low point apparently being reached in the latter year, when only 15,511 square yards were imported, as against a pre-war average of 57,147. In 1920, however, imports increased to almost twice, and in 1921 to more than three times the pre-war average.

Importations of Aubusson, Axminster, and chenille Axminster carpets show a somewhat similar movement, but although in 1910 with importations of 23,084 yards they were approximately equaled by velvet and Wilton; in 1921, with 185,360 square yards, they were over three times as great as the increased imports of Brussels, Wilton, tapestry, and velvet combined. This buoyancy is apparently due to the strength of chenille Axminster carpet.

Ingrains, and the miscellaneous carpets and rugs included, were imported to a less extent during this latter period than the preceding.

(c) RELATION TO DOMESTIC PRODUCTION.

The source and type of imported carpets indicate their relation to domestic production. The handmade product, of which the great bulk of the importations is composed, is not made in this country. Importations are in the nature of a luxury article and are directly competitive with the machine-made grades produced in this country only to the extent that articles of different character, put to the same use, may be so considered. The choice is a matter of taste or fashion rather than of durability or price.

Interest centers rather in the imports of the machine-made article, especially under the 1913 tariff act, which has been followed by increases in the imports of this type. In the following table a comparison is made between imports of the various types during the calendar year 1914 and the domestic production for that year. It must be kept in mind in interpreting these figures that the calendar year 1914 represents maximum importations, and that the comparison is of direct bearing on the competitive situation only in the case of the machine-made types, forming as they do only a small portion of the total imports.

[2] ndar year.
[3] mall portion of machine-made included under "Carpets woven whole for rooms."

ports of machine-made carpeting during the year 1914 were 0.67 per cent of the domestic production in yardage and 0.95 ent in value. For Wilton carpets and rugs these percentages 2.01 and 1.85, respectively; for tapestry, 1.02 and 0.85. Other of carpeting show an even less proportion. If the handmade ting, largely oriental, be included with the machine-made, the imports represent an amount equal to only 2.06 per cent of the ıge produced in 1914, and 6.83 per cent of the value. The ɔpancy between these two figures is to be expected from the .cter of the trade in foreign rugs; many of those handled are es of high price, and are from the point of view of yardage a ı less important part of the trade than from the point of view of

e fact that Axminster and chenille Axminster fall under the first classifications, according as they are rugs or carpets, makes ssible an accurate statistical comparison between imports and ıction of these grades. In view of the growth of imports of lle Axminster, it is unfortunate that such a compa·ison is not drawn.

(D) ORGANIZATION OF IMPORT TRADE.

w York occupies a position of predominance in the trade in rted articles. Sales of imported fabrics are consummated in ent ways. One British firm maintains a selling agency in New ; another sells through a manufacturers' agent. Another British engaged in the sale of both British and oriental carpets and rugs recently made an arrangement to sell through an American r.[31] In general, however, the method of sale is through traveling s of European firms. During the winter 1919–20, however, many rs from the United States went to Europe. France is the exceɔ the above rule in not sending salesmen to the United States.

[31] British interest controls factories in the United States and Great Britain.

For oriental products the trade usually is through traveling agents of American importing firms. These agents visit the rug markets of Asia, buying rugs and carpets for their firms in New York for distribution in the United States. Many of these importing firms are conducted by men of eastern nationality, who are acquainted with business conditions and methods in oriental countries, and who often have extensive business connections there.

SECTION 9. DOMESTIC PRICES.

Figures for monthly prices of standard grades of Wilton, Axminster, tapestry, and Brussels carpets are presented in Appendix II, page 148, where both absolute and relative prices are given.

Between 1913 and 1920 prices increased enormously. By May, 1915, prices for all four grades had risen; by September, 1918, they were double the 1913 average; and by June, 1920, they had risen by over 200 per cent for all four kinds. Early in 1921, however, they began to decline. By the end of the year, they were only about double the 1913 prices, and they did not change materially until the latter part of 1922. The actual prices were as follows:

Kind of carpet.	Price per running yard.		
	June, 1914.	June, 1920.	June, 1922.
Brussels, 5-frame, 9-wire, 256-pitch Bigelow	$1.272	$4.320	$2.70
Wilton, 5-frame Bigelow	2.328	7.104	4.60
Tapestry, 8-wire, 200-pitch	.650	2.100	.....
Axminster, 6¾ by 7, 189-pitch	1.056	3.800	2.20

The increase in prices for June, 1922, above those quoted for June, 1914, were: Wilton, 98 per cent; Axminster, 108 per cent; Brussels, 115 per cent. The average increase for the three carpets was 105 per cent. The course of rug prices has been similar to that of carpet prices, showing a somewhat more rapid increase. That of four kinds of 9 by 12 Wilton rugs from 1915 to 1920, prices for which were available to the Tariff Commission, amounted to 207 per cent; that of three kinds of tapestry rugs of the same size from 1914 to 1920 amounted to 278 per cent; of four kinds of velvet rugs of the same size for these years to 257½ per cent; of four kinds of Axminster rugs of the same size, to 240 per cent.

The increase arose from war conditions, in the main from the effects of the war upon trade in raw materials, upon labor, and upon general demand. The carpet industry was regarded as a luxury trade by Great Britain and the United States, and Government control of shipments and raw materials was in accordance with this view. Partly on this account there was greatly decreased production during the war, which furnished a basis for price increases.

From the foregoing figures it will be seen that the Wilton bears the highest price per yard of any of the fabrics, Brussels, Axminsters, and tapestry following in order. The prices of velvet and of chenille Axminster carpets are not included; the first of these falls between that of tapestry and Axminster, and the second with or above that of the better grades of Wilton.

eral, the price per square yard is higher for seamed and seam-
than for roll goods. The table presents, however, two ex-
One seamless velvet rug is sold at a lower price than the
nding carpet; so, also, is one seamless Axminster rug. In
e these are products made extensively by large manufacturers.
ercentage by which the price per yard of a rug exceeds that
pet varies somewhat for the different kinds. In the table
he seamed Brussels rug exceeds the roll goods in price per
ard by over 16 per cent; the wool Wilton seamed rugs exceed
goods by from 8 to 25 per cent; the worsted Wilton by about
cent. The tapestry, velvet, and Axminster seamless rugs
exceed their respective grades of roll goods by from 4 per cent
er cent, with the exception of the two cases mentioned above.
n the seamless chenille rug and roll goods the difference is
ight because of the close similarity in methods of manufacture,
chenille roll goods quoted are made in 9-foot breadths, just
he rug upon which these square-yard prices are based.

Chapter III.

FOREIGN MANUFACTURE.

Section 1. Handmade Rugs.

(a) countries.

The foreign manufacture of handmade rugs is carried on in two regions which are distinct in the nature of their product, Europe and the Orient. The European industry is a small survival of the old hand manufacture which was superseded by power-driven machine industry. The product is largely a luxury article, almost entirely made to order, salable by reason of fine quality and the fact that such rugs can be designed to meet any requirement as to size and shape. Great Britain, France, Germany, and Austria all maintain a certain amount of hand production. Among the products the Aubusson and Savonnerie carpets of France and the Axminster of England have a reputation for high quality. The European rug is woven on the simple hand loom, and in this differs from the oriental; in basic structure it is the same, and it finds much the same market. In comparison with the consumption of oriental carpeting in the United States that of the European handmade product is small.

Asia Minor and Central Asia are the most important areas of oriental manufacture. The distribution is indicated by the fact that oriental carpets are commonly classed as Turkish, Persian, Caucasian, Turkestan, Indian, or Chinese. China and India rugs have not been looked upon as favorably as the other varieties. The best known Turkish rugs are those made in Anatolia and nearby; at Ghiordes, Demirdji, Oushak, Bergama, Ladik, and Smyrna. Persian rugs come from Tabriz, Kermanshah, Saraband, Kirman, Shiraz, and Hamadan. Caucasian rugs are woven in the Provinces of Daghastan, Kabistan, Karabagh, and Shirvan. The Turkestan rugs are the product of nomadic people of Central Asia, about Bokara and in Afganistan and Beluchistan. Indian rugs are largely from Amritsar and Agra, and Chinese from Tientsin and Pekin. The early Chinese industry was located in Kansu, Shansi, and Shensi, Provinces which border Mongolia. The industry at Pekin and Tientsin is of comparatively recent origin.

Formerly it was possible to determine the source of oriental rugs from the designs which were traditional in these different localities. For instance, the Turkish rugs were woven in geometric patterns with gaudy and inharmonious colors, while the Persian rugs were of fine patterns, largely floral, in rich, subdued, and harmonious colors. The Caucasian rugs were even more crude in design than the Turkish. The influence of the extended trade in oriental rugs in the Occident, however, has resulted in changes in design to meet European demands or at least what the dealers in the regions consider these demands to be. The result has been to make it practically impossible any longer to determine the origin of the rugs from their design.

(B) METHOD OF PRODUCTION.

—Wool is more widely used for warp and filling in
n in European. A wool warp is typical of Turkish,
urkestan rugs. Other yarns used are the same as in
ustry in Europe and the United States; in fact,
l jute yarns are usually imported from these regions.
lly employed as warp, the ends appearing, after a
a fringe.
l ordinarily comes from the district in which the rug
l for the best rugs comes from sheep which are housed
any cases, are covered with linen coverings. These
the wool clean and cause it to become so saturated
; that it is kept soft and glossy.
e, or were, largely vegetable. Colors frequently used
rcelain, blue, orange, crimson, rose, red, and green.
rom occidental countries and the perfection of aniline
yes has resulted in their being used to a certain extent
. The success of such use seems to depend upon the
dyes used and the skill and care with which they are

Throughout the Orient weaving is done principally by
and boys. Customarily these work as a family under the
the oldest or most experienced member, sometimes in
ted by the weaver.
e war.—In the East the European war has profoundly
stry. Wages of carpet weavers have risen from three to
ne pre-war rates in Syria, Circassia, and Persia. A dimi-
e number of workers is reported, and the dislocation and
f trade since the close of the war have retarded a return
ar basis of production.

) ORGANIZATION OF MANUFACTURE AND MARKETING.

nization of the rug trade in the East before the advent of
rol from western firms varied somewhat with localities, but
ing description may be taken as typical, and would, of
ply to a large number of places to-day which still remain
direct occidental influence. The making of a rug is con-
the leading merchant of the town. He provides the
with wool, pays the dyer and the weaver, keeps an eye on
ess of the work, and appropriates the rug when it is finished
y for sale at the next fair. This head merchant, besides
e wages per "pick," often has in addition the control of the
e and thus more or less complete control of the weaver's life.
es the rugs are sold in the shop of the head weaver to traveling
ts, and they thus find their way to Constantinople or other
nt markets. Such merchants collect a number of rugs, put
to bales, and sell them in this form rather than singly.
e the rug and carpet production in the Orient has fallen under
tern influence this rather crude distributive system has been
l to some extent in order to improve production and facilitate
chase of rugs by western merchants.
xample of this is the manufacture of rugs in the region around
a. Here a firm with a capitalization of $2,000,000 was formed

by a combination of five smaller concerns previously operating in this district. This concern has set up a spinning plant near Constantinople and a dyeing plant near Smyrna. The yarn is spun at their plant, taken to Smyrna and dyed, and sold to weavers, usually on credit. The designs of the rugs desired by the company are supplied the weavers and woolen yarns so dyed as to fulfill the requirements of the design. Cotton yarns the weavers purchase from other dealers. When the rug is completed the company will buy the rug, although the weaver is not bound to sell to it. In fact, buyers compete in the purchase of rugs. Occasionally the representative of a whole village, acting as tribal chieftain, will contract on behalf of his community to deliver a certain quantity of rugs in a year, the company to supply the yarn. In this case the sum is stipulated and the company takes the rugs as woven. Rug designs are made up for the most part in the Smyrna office. Some orders are placed with the Smyrna company by importing houses which have drawn up their own designs. The taking of special orders for rugs of particular designs and sizes is unusual.

At Tabriz a German firm had prior to the war erected a factory, in which was located machinery for dyeing and spinning yarn. Some European labor was used. At present the factory has been taken over by a British firm, reported to be in the control of an eastern merchant. Sample rugs are made here, and these, with the yarns appropriately dyed, are taken to the weavers in near-by villages, who weave the rugs under close supervision. It is reported that 1,000 European workers are to be used at the Tabriz factory.[1]

In India the industry is organized on the factory basis at Amritsar and Agra, the important centers. The yarn is locally dyed and spun. The weavers are largely boys, from 10 to 20 years old, working under a master weaver. The making of rugs is also carried on in the jails.[2] The factories employed 2,900 wage earners in 1917.[3]

The demand for Chinese rugs has been relatively recent and has resulted in large numbers of rug buyers going to China. The weavers there works under contract or orders from foreign countries. The factory system is very similar to that in India.

(b) THE EFFECT OF OCCIDENTAL INFLUENCE.

The ordinary criterion of the quality of an oriental rug is the number of knots per square inch. Other elements are of much importance, however.

The portion of the oriental product produced directly under western control, even in its most attenuated form, is probably small, and this fact must be kept in mind in judging the effect of such control. Certain advantages in marketing the product, such as its production at a stated time and control of design with the object of getting a product marketable in the West, are involved in, and to some extent form a reason for, the introduction of this organization. The control of design has, where effective, eliminated the insertion in the regular pattern of some extraneous motif to suit the personal idiosyncrasies of the weaver, which often was a real detriment to the rug. A more

108.
re with the high United States figure, 265,000 running yards in 1894.

Imports into the United Kingdom have been smaller in amount, but have shown much the same course. In 1913, they amounted to somewhat less than 2,000,000 square yards, of which slightly less than 30 per cent were reexported. This 30 per cent, however, consisted largely of the more valuable rugs, so that it represented over 60 per cent of the total value of the imported articles. Imports during 1919 were slightly over 600,000 square yards, 45 per cent of which were reexported. In 1920, however, the yardage imported increased to practically the same figure as in 1913, about 35 per cent of the imports being reexported; in 1921, the yardage imported declined to about 88 per cent of the 1913 figure, about 23 per cent being reexported.

Imports are largely oriental. Machine-made foreign goods which find a market in the United Kingdom are principally from France, and, before the war, Germany and Austria. The French products are largely Wiltons, which are of good quality and wear well. The German and Austrian goods are in large part chenille Axminster of the extremely cheap grade not manufactured in the United States.

Great Britain, whose machine carpet industry is second only to that of the United States, thus occupies a commanding position in the world's carpet trade; she is not only, as is the United States, an important manufacturer of these products, but also handles a large share of the world's traffic in them, both as exporter of her own manufactures and as importer and exporter of foreign-made goods—her position in the latter trade being due largely to her acting as an entrepôt of eastern rugs.

Labor—Number of employees.—The last British census presenting statistics of wage earners—that of 1911—gives the following figures for persons employed in the carpet and felt industry. The inclusion of the manufacture of the last-named article of course results in numbers in excess of those actually employed in the carpet industry.

Number of wage earners employed in the carpet and felt industry in the United Kingdom.

[Census, 1911.]

	Persons.	Male.	Female.
England (total)	15,302	6,982	8,320
Worcestershire	6,339	2,757	3,582
Yorkshire	5,371	2,237	3,134
Lancashire	1,413	992	421
Scotland	5,987	2,081	3,906
Ireland	280	58	222
Total	21,569	9,121	12,448

The total number of persons employed in the carpet and felt industry in the British Isles was thus 21,500, only 6,000 of whom work outside of England. Over 57 per cent of these workers were women. This figure is higher than the percentages recorded in any previous British census. The employment of women increased continuously from 1861, when only 18.3 of all wage earners were women, until it reached the high figure of 1911. This increase has been attributed to the severe competition which began somewhat after

irst importations of American Axminster carpets
n resulted in the employment of women at the

ton & Co. give this rate with the following statement: "We understand that when the urers made inquiries as to wages, they found that most of the manufacturers were pay- for the most usual quality which has 7 picks or shots to the inch. * * * This might base rate, as the manufacturers concerned are paying on this a percentage based on the of living figures."

, submitted by McCleary, Wallin & Crouse, to Committee on Ways and Means, Feb. 19, rings, 1913, p. 4508.

s here presented for the two countries are strikingly alike, the case of Wiltons, for which the British wages given are the American. In the case of Brussels, the British wages except for hair carpets, higher than the American. For weaving the rates stated for Great Britain are somewhat pt in one case of two-loom weaving; they are generally t over two-thirds of the American rates. Comparison can ly be made for velvet; the American wages seem the larger. British wage rate quoted for Axminster carpet was supplied s Templeton & Sons Co., and stated to be fairly general in e. Only two of the American rates quoted exceed this, h of these are for rug, not carpet, weaving. For chenille er the source of the British figure quoted differs from that est of the table, and the amount of the discrepancy between

the British and American wage can not well be compared with t for the other kinds of carpets.

The weaver and his assistant perform tasks other than the m operation of the loom. The payment for these tasks, as well the character of the tasks usually performed, differs between the countries and even among the different companies, according to ferences in mill practice. Wages for the subsidiary operations are easily compared than weaving rates. The wage paid for time-w in the weaving room may be used as typical of such wages; rates were 7 and 7½d. per hour, which, with a bonus of 130 per cent, w amount to 32.6 and 35 cents, respectively. Three American f reporting to the commission each pay 93½ cents per hour. A c parison between the wages of loom fixers (called "tuners" in G Britain) in the two countries yields a similar result. The base for a tapestry loom fixer in a large British firm has been stated t 50s. per week—with the above bonus, $27.98 per week. The m mum wage for fixers in one American factory is $58.43 per week.

Change in relative position between the two industries during since the war can be judged from the increases which have taken p in rates in the United States and in Great Britain. For piecewor in the latter they amounted to 140 per cent in July, 1920. Incre have not, of course, been standardized to the same extent for American mills that they have for the British. Of 31 American fac ies reporting to the Tariff Commission not one showed an incre either for weaving or other subsidiary operations, of less than 40 cent. Four reported an increase of less than 80 per cent for weav 9 an increase of from 80 to 119 per cent; 6 from 120 to 159; 77 from to 199; and 3 of 200 per cent or more. For operations other than w ing data are available from only 25 firms; a higher percentage of t report increases of from 120 to 199 per cent than is the case weavers—an indication of a greater increase in these relatively skilled operations. For both classes of labor the increases thus erally run from 100 to 200 per cent. Those above the latter figure only slightly in excess of it.

A further comparison of American and English wages may derived from the following statement submitted to the commis by an American manufacturer; the figures quoted are wage paym in a representative American mill and in a representative Eng mill for various operations in weaving tapestry rugs.[13]

TABLE 2.—*Comparative wage rates of a representative American and a represen English mill, July 1, 1920.*

> fix a rate, and then a man is free to earn as much as he can. In our America
> they will point with pride to a man who is the biggest wage earner. In this c
> if a man gets even an average, he wants to sneak away with it. (British Tarif
> mission, 1905, Vol. II, pt. 5: Carpet Industry, par. 2937–8.)

The charge is not made that there is a definite rule restricting
put, but that a consensus of opinion as to the amount a man sh
turn out results in a less product than that of which the worke
capable.

Prices.—Comparison of British with American prices perhaps
clearly indicates the relative competitive position of the two i
tries than the wage rates, which have been discussed above. B
prices are available from price lists published by one British m
facturer, samples and prices furnished the Tariff Commission
second, and statements of American importers. Figures sel
from these sources have been presented in the table below, tog
with prices of American articles which were judged to be most n
comparable. Differences between foreign and domestic fabrics
the comparisons less accurate than the comparison previously
between the different forms of American carpeting. A basis for
paring grades has been furnished by analysis of samples of imp
carpet and the statements of American importers.

British prices occupy the first two columns of the table; the
is the British price plus the United States duty, with an addit
6 per cent to cover importers' charges in this country;[14] the f
column contains American prices as nearly comparable as pos
with the British prices preceding.

e no alterations in prices.[15]

pholstery Trade Review, Nov. 15, 1920, p. 52a. At a subsequent meeting (Jan. 15
that no alterations would be made before July (*Idem*, Feb. 15, 1921, p. 46.)

(B) EUROPE.

Compared with the carpet industries of the United States Great Britain, those of continental Europe appear small. In Fr the foundation of the manufacture of carpeting by power-dr machinery dates from 1880, when power looms were introduced f England. In the last available census the total number of v earners employed was given as 7,500 for 1906. In Germany number of wage earners employed in 1907 was 4,614.[16]

These figures, it is believed, represent fairly accurately the c parative importance of these two countries as producers of car ings, and may be compared with the number of wage earners in industry of the United States in 1909—33,307. Other produ countries are Austria, Bohemia, Belgium, Holland, and, to a slight extent, Spain. The hand industry represents but a small portion of the European production; its importance, in relatio the United States, lies in the fact that the product is not n here—is, in fact, totally unsuited for American production—and h the supply must be sought abroad.

The kinds and forms of carpeting produced and used in contine Europe do not differ materially from those in the United St though the lower standard of living represents a proportional res tion on the consumption of floor coverings. As in England, the a more extended use of carpets, as opposed to rugs, than in United States. Germany has given her attention to the manufac of ingrains and cheap chenille products; the latter she attemp to market in the United States, but as they did not meet the requ ments of American taste, her efforts were not successful. S fine Wiltons, on the other hand, have been sent to this coun France makes very few chenille fabrics; her Wiltons are of excel quality.

The extent to which European countries have recovered f the effects of the war differs very markedly among countries. can now obtain German dyestuffs as wanted. Manufactu has been actively resumed in Belgium and Holland, as in Engl Industry in the central regions of France has recovered to a g extent. The carpet industry of Austria is, as are all her indust not yet on its feet; there is great shortage of all the things neces for the prosecution of manufacturing—food, fuel, and raw mate German industry is already making an effort to sell its prod in the United States, and, in the opinion of one of the import it is a German firm which is most likely to sell its carpetings in American market.

[16] Report of the Tariff Board on Schedule K, 1912, p. 174.

CHAPTER IV.

F PRODUCTION IN THE UNITED STATES.

SECTION 1. SUMMARY.

nission, by means of questionnaires, obtained cost
ıpanies engaged in the production of carpets and
ıng the returns, the Commission found a lack of
accounting methods of the firms reporting, especi-
ıution of the overhead, and it was therefore com-
number of minor adjustments in the figures in
ı on a comparable basis. On the whole, however,
are fairly comparable.

the investigation are set forth in Table 1, page 87,
ꝛ the factory costs of producing various kinds of rugs
)15 and 1919, and in subsequent tables which give
With the exception of worsted Wilton, which cost
square yard in 1919, the highest cost of any fabric
ıille Axminster, which ran about $3.40 per square
l somewhat more than $6 in 1919. Wilton fabrics
same range of difference between 1915 and 1919.
ɛapest product reported, ranged from $0.65 to $0.70
in 1915 and from $1.50 to $1.65 in 1919.

re rugs and roll goods are produced in equal volume,
d of rugs, either seamed or seamless, is greater than
ds. For Wilton rugs, both wool and worsted, the
ɔn is from 5 to 30 per cent more than for roll goods;
ꝛ about 8 per cent more. On the other hand, certain
ods are produced at a lower cost than rugs of the
'or example, in 1919 velvet carpeting cost about
in the rug form than in roll goods; Axminster and
ıter, about 12 per cent less. The lower costs of rugs
ed fabrics are probably due to the relative volume
)f the two forms and to the fact that certain mills
ꝛs.

tendency toward a higher cost for rugs than for roll
ɪr shown in Table 1a, page 88, which gives, by com-
centage by which the cost of the one form exceeds
er.

ng the relative costs of producing rugs and roll goods,
portance is the comparative efficiency of the looms.
ugs are assuming a larger place in the factory output
ꝛs are being reduced by increased efficiency of the
ꝛ shown by Table 1b, page 89, which gives the average
loom per 10 hours for the various kinds and forms of

In practically all cases the square-yard production for roll goods exceeds that of the same kind of fabric in rugs; in three out of four cases there has been a reduction per loom per 10 hours for roll goods in 1919 as compared with 1915, while in every case there has been an increase in the production of rugs.

Table 2, page 90, gives the detail of the totals shown in Table 1, i. e. the average costs of material, labor, and overhead (the factors comprising total factory cost) for roll goods, seamed and seamless rugs of the various kinds and fabrics. In every case material is the chief item of total factory cost. Variances between the percentages for labor and overhead are usually due to the manufacturing process through which any particular fabric must pass. For instance, in the production of velvet the labor item is small, constituting not more than 18 per cent of the total cost, whereas in the Wiltons it is larger than overhead, constituting about 22 per cent. Between 1915 and 1919 the cost of labor more than doubled; that of material just about doubled, while the increase in overhead varied.

Table 4, page 96, shows the ratio of the cost of wool to that of total materials for each kind and form of fabric in 1915 and 1919. That the cost of wool was proportionately less in 1919 than in 1915, may be explained in two ways—that less wool was used in 1919 per square yard of product than in 1915, or that other materials (cotton, linen, and jute) have advanced in cost more than wool since 1915. Among the several types of carpetings the proportionate cost of wool to total materials varies greatly—from 48 per cent for tapestry to 83 per cent for chenille Axminster. These facts are of significance if duties are to be levied to compensate any duties which may fall on carpet wools.

In the production of a commodity the raw materials of which may be purchased in a world market (as is the case in carpetings) conversion costs rather than total costs are of significance [1] for tariff purposes. In 1919 conversion costs per square yard of carpeting ranged from 47 cents in tapestry roll goods to $3.39 in chenille Axminster roll goods. It is, however, even more pertinent to compare conversion costs between the several forms of the same fabric. In the case of Wiltons and tapestries, the conversion cost of rugs exceeds that of roll goods approximately 90 per cent and 33 per cent, respectively. On the other hand, the conversion cost of velvet, Axminster, and chenille Axminster roll goods shows an excess over that of rugs, ranging from nearly 50 per cent in the first two to a scant 1 per cent in chenille Axminster.

Supplementary data to the average conversion costs for domestic carpetings are presented on page 98 for comparable costs of competing American and British chenille Axminster floor coverings. The figures show: (1) That the *selling price* f. o. b. New York of imported goods is less than the total *cost* for American goods. For instance, the grade of designed goods sold f. o. b. New York at $2 per square yard, is manufactured in the United States at a cost of $2 per square yard. (2) That the American conversion cost is higher than the combined figures for labor, overhead, and profit of British-made chenilles. The conversion cost per square yard of designed goods made in America is $20, as compared with $9 for conversion and profit

[1] See discussion of Table 5, p. 97.

the British goods. These figures clearly indicate hich this type of floor covering must meet from of a similar type.

ıe financial condition of the wool-carpet industry leaned through the Tariff Commission's study of s for 1915 and 1919 furnished by manufacturers. ɔrought out are as follows: Total assets per square ave generally increased by about 50 per cent since ranging from $2 to $7. An analysis of total assets that the major portion of such increases occurred . There are instances where such increases not ases in fixed assets, but augment the total assets. e company shows an increase in total assets per approximately 25 per cent. Fixed assets in this ıore than 25 per cent, but current assets increased t.

the industry bespeak a healthy condition through- 915 to 1919. This conclusion is supported by the 9, page 103, showing the high and low percentages of een cost and selling price per unit for the various kinds ıbrics as compared with the average. Tapestry roll erences ranging from 94 per cent to 39 per cent, but age indicates an 86 per cent difference. For worsted form the weighted average difference is 47 per cent, range from 83 per cent to 39 per cent.

me profits have been kept in the business, and would ırplus, undivided profits, and reserve accounts. The us, undivided profits, and reserves per square yard, 9, indicates that these accounts have been built up od 1915 to 1919. In all except two of the cases shown en increases averaging 100 per cent—equivalent to an ıse of 90 cents per square yard—over this period of

SECTION 2. GENERAL CONSIDERATIONS.

ing cost were obtained from 39 companies in the trade a questionnaire, and by examination of the books of lishments by representatives of the commission. Such the costs involved from the time the raw material of yarn) was purchased until the product emerged from ready for sale as a floor covering. In some instances ake the wool in the grease and develop it through the ages to the finished carpetings. Others purchase their to be dyed and woven into floor coverings. Conse- term "raw material" has different meanings among anufacturers. As used in connection with costs pre- , it signifies "yarn ready to be dyed and woven into A number of plants were unable to supply figures for ınd 1919, either because business was started subsequent e had destroyed records, records were not kept over that ime, or because the products manufactured in 1915 were able with those made in 1919.

In addition to cost data obtained for the main types of rugs and carpets discussed in this report, some costs were received for machine-made oriental rugs, a phase of the industry now in the experimental stage, but which may have a considerable development in the future. The details of these costs can not be given because of the possibility of revealing confidential information. The various cost factors, however, have the following relation to each other:

	Per cent.
Materials	35
Labor	40
Overhead	25
Total	100

A rug, approximately 9 by 6 feet, of this make was recently advertised at $126 retail, or at the rate of $21 per square yard.

The ingrain branch of the industry is fast passing out of existence. Just as rapidly as ingrain plants can absorb the attendant loss, ingrain looms are either scrapped or converted for use in making floor coverings of fiber (paper) or of fiber and wool. There are now only one or two establishments which produce ingrains, and the values in the trade are decidedly inconsequential. As it was difficult to get accurate costs, and as the manufacturers repeatedly stated that they desired no tariff revision on ingrains, cost data pertaining to their manufacture are omitted.

Originally it was contemplated asking for costs on such forms as were employed by the individual companies, but preliminary visits throughout the industry showed a lack of uniformity in accounting methods. As an alternative, the Tariff Commission prepared a questionnaire and requested that the data furnished conform as nearly as possible with the classification presented.

One of the chief obstacles to obtaining comparable statistics was the lack of standardization in products throughout the trade. Copyrighted trade names have no significance without details as to the structure of the fabric. It was impossible to find one grade of carpeting of a given kind made by all manufacturers, e. g., no standard grade of wool Wilton in roll goods and in seamed and seamless rugs is made by all or, in fact, by any two manufacturers. To overcome this difficulty specifications were outlined for one grade of each kind of floor covering, and manufacturers were requested to submit cost data on goods meeting these descriptions or on those nearest approaching such descriptions. If these specifications differed in any respect from those outlined by the Tariff Commission, certain minor adjustments were made to get the figures on a comparable basis.

Another difficulty in the way of obtaining data was the poor accounting systems of individual firms. Attempts to improve the old systems have in the main been haphazard. The absence of detailed records caused difficulties in separating costs for the several different classes of fabrics and the different forms of the same fabric. In the case of certain plants a substantial business was carried on in other lines of the textile industry, but no accounting for separate lines was maintained. In some instances this side line took the form, not of

of trading in raw materials, which rendered the
still more difficult.
ad expenses for any particular class or grade of
en found to be a mere estimate than an accurate
xpense for the entire plant was determined when-
closed, but for the most part no distribution was
lepartments (i. e., to a Brussels or Wilton, or even
department, if other textiles were produced).
ssion has made no attempt to establish a uniform
ıg such expenses; instead, it has accepted over-
bmitted, with accompanying explanation of the
ch concern reporting. The manner of allocating
ıds upon conditions prevailing at each individual

ses for distributing overhead are in use:
on yardage basis. That is, each yard of product
e of total overhead. (This method may be applied
duct is made and is of a uniform grade.)
on basis of quantity of floor space occupied.
is charged that percentage of overhead which the
d by it bears to the total factory floor space.
on basis of material cost of each unit of product
total material cost for all products.
on basis of direct labor. That is to say, if all
are, say, 50 per cent of total direct labor cost, a
hich has labor cost of $1 should have an overhead
, or, in other words, direct labor for any product is
percentage which total overhead bears to total

ı on basis of a combination of material cost and
ethod outlined in (4).
n on basis of loom hours consumed. A rate is
viding total overhead charges by total of actual
gives the charge per loom hour. The rate is then
nit of production according to the number of loom
ıuired to produce it, as shown by the machine record
t of every grade of production.
everal elements of overhead expenses are distributed
. The item of power, light, and heat, for example,
ed on the basis of actual energy consumed, measured
ırance may be allocated on the basis of fire risk for
pplies by actual amounts used, and depreciation by
each particular building or unit of equipment.
owing out of these several methods are not of serious
the final costs, and hence no attempts to reconcile
made. It is probable that some uniform method
applied, but because of the great diversity in the
ıods of the various firms any scheme of distribution
l reports would have been arbitrary and likely to
ors than it corrected.

table are weighted averages except wool Wilton roll goods for 1919.
1919 is a simple average. Data sufficient to ascertain a weighted average were t is believed that this simple average is sufficiently accurate to render a com- of definite value.

ne figures of costs presented here, comparison may (*a*) the costs of the different types of floor covering; ne different forms of carpeting; and (*c*) costs for 1915 ne different types and forms.

parison of costs for the different types it is evident ostly are chenille Axminster and worsted Wilton; l Wilton and Axminster, the medium grade; and nd tapestry.

f the average costs of the different forms of floor itated by reducing the absolute figures given to rela- it is, by establishing a base as 100 per cent and er costs on this base. The calculations in Table 1 l on roll goods as 100 per cent in each case, and costs eamless rugs determined are from this base. For in- of Axminster roll goods in 1915 was 99 cents; for .27; and for seamless rugs, $1.31. Taking 99 cents e relative cost of roll goods thus appears as 100, of 128, and of seamless rugs as 132. Relative figures

ed from details submitted by the several manu-
igned to show the variations in costs of material,
l among the different companies, for roll goods,
ss rugs of the same fabrics. These costs are
ds, in order that fluctuations may be registered.
ween the weighted average totals for each form
shown in Table 3 is of interest in supporting
fect that the production of rugs is more efficient,
nsive, than that of roll goods. The majority of
luce rugs. Rug costs have not advanced to as
ave roll goods in the period 1915–1919.
rage figures for chenille Axminster show seamless
ion less than roll goods. This is accounted for by
s doubtless a greater production of seamless rugs
nd that those companies producing seamless rugs
ow figure. This explanation also holds true for
Axminsters.
ods, Axminster, with 214 per cent increases over
reatest of any increases shown. Rugs of worsted
) and chenille Axminster (80 per cent) show the
floor covering costs from 1915 to 1919.
substantiates the conclusion drawn from Table
ave doubled since 1915.
ich wool yarns constitute of the cost of materials
facture is of significance if compensatory duties
he finished product.

[1] See footnote, p. 86.

Table 4 shows the percentage which wool costs form of the t material cost in each kind of carpet. Percentages derived from l weighted and simple averages are presented. Weighted averages somewhat more accurate, but the simple averages are given as a g where it is impossible to get weighted averages, as, for exam Brussels and wool Wilton roll goods for 1915 and seamless rugs both 1915 and 1919.

In practically every instance wool is less of a material facto seamless than in either of the other two forms of floor coveri The greatest spread between forms occurs in worsted Wiltons 1919, when the wool in roll goods was 79 per cent of the total mat costs, and in seamless rugs, 60 per cent. Chenille Axminster sh the greatest percentage of material costs for wool, and is followe close order by wool Wilton and worsted Wilton. Axminster leads group composed of Axminster, velvet, and tapestry.

It will be observed that wool costs represent less of total mat costs in 1919 than in 1915, being more pronounced in cheaper gr of carpetings (velvets and tapestries) where the ratio of wool to t material costs has decreased approximately 10 per cent. This be accounted for in two ways - that less wool was used in 1919 square yard of product than in 1915, or that other materials (cot linen, jute) have advanced in cost more than wool since 1915.

It is evident that if foreign and domestic manufacturers buy t raw material at practically the same prices—as is the case wi world markets exist, such as those for the various fibers used in m ing carpets - the competitive strength of these producers, so fa

, depends upon the cost of labor and overhead, al factory cost. Table 5 gives comparative con- several kinds of domestic floor coverings.

5.—*Conversion costs (labor and overhead).*

arpeting.	Weighted average.		Ratio to total costs.	
	1915	1919	1915	1919

not as yet a stable commodity in the industry. It partakes of the nature gures are not taken into consideration in making a study of this table.

posite of labor and overhead charges shown in hile the percentages which conversion costs form are given as of possible statistical interest, ac- ge) costs in dollars form the basis for tariff con- be observed that conversion charges in 1919 cent of total factory cost of American made lly the charges vary from $.4662 per square yard 2 per square yard of chenille Axminster. The russels seamed rugs, 1915, show the lowest per- . However, the advantage in value is held by

hat the conversion charges are generally lower , velvets, and Axminsters—carpets the manufac- hich have been most highly developed in the for those entailing considerable hand work, such and Smyrna. The goods produced in greatest v the lowest actual conversion charges. Ameri- rged ahead where mechanical processes have and processes. The cost of hand work in the an insurmountable barrier to effective competi- idmade floor coverings with imported ones. In

the carpet industry, as well as other industries, American manuf turers have been at a disadvantage in meeting foreign competit with articles the labor element of which runs high, and on su articles protective duties have been effective in stimulating grow On the other hand, where mechanical processes were most fully dev oped with a resulting reduction in labor costs, the competitive po tion of domestic manufacturers has been strong.

The great increase in labor costs between 1915 and 1919 is a reflected in this table. Conversion costs have advanced 350 p cent in Axminster roll goods. From this high point the advan range to the lowest (55 per cent) in chenille Axminster seamless ru

A more important indication of the competitive positions of forei and domestic manufacturers are conversion costs in the Unit States and abroad. As has been pointed out elsewhere in this repo chenille Axminster has been subject in a peculiar degree to compe tion from Great Britain.

It has been possible, through the cooperation of certain importe and of domestic manufacturers, to prepare an exhibit showi comparable costs of competing American and British chenille A minster floor coverings. Due regard has been had in this exhib for the factor of exchange rates.

An American manufacturer furnished figures on two grades chenille rugs or carpets and one grade of chenille roll goods, and cos were obtained f. o. b. England of two grades of chenille rugs carpets of practically the same specifications and of one grade chenille roll goods of different specifications but which competes wi the domestic product.

The comparison of these costs per square yard follows:

Chenille rugs.	Total cost, American.	Selling price f. o. b. England.	
		Normal.[1]	Subnormal.
Plain goods:			
Grade A	$12.26	$8.14	$
Grade B	13.27	9.12	
Designed goods:			
Grade A	24.48	13.38	1
Grade B	25.87	15.45	1

[1] Normal exchange is taken at $4.8665; subnormal exchange is taken at $3.80, in all these calculati

The cost of these two grades, adding the present 50 per cent du and 10 per cent for freight, insurance, etc., is as follows:

Chenille rugs.	Total cost, American.	Selling price f. o. b. New York.	
		Normal.[1]	Subnormal.
Plain goods:			
Grade A	$12.26	$13.02	$1
Grade B	13.27	14.59	1
Designed goods:			
Grade A	24.48	21.41	1
Grade B	25.87	24.72	1

[1] Normal exchange is taken at $4.8665; subnormal exchange is taken at $3.80, in all these calculati

it will be seen that at the rate assessed by the
n manufacturer can sell in America at a price
ican manufacturers' cost except in the instance
e exchange at normal, in which case the Amer-
a leeway for profit of from about 6 per cent
igned goods his costs are from 5 per cent to 15
ever, than the English manufacturers' selling
rmal exchange, and from 34 per cent to 47 per
rice at subnormal.

lable to show English labor costs in chenilles,
materials are purchased in a world market at
countries, and deducting said material costs,
for plain, grade A, $3.46; plain, grade B, $3.70;
3.99; designed, grade B, $4.15, the following

lle rugs.	Labor and overhead, American.	Labor, expense, and profit, English.	
		Normal.[1]	Subnormal.[1,2]
.....	$9.80	$4.68	$2.90
.....	9.57	5.42	3.43
.....	20.49	9.39	6.46
.....	21.72	11.30	7.92

$4.8665; subnormal exchange is taken at $3.80 in all these calculations.
s to call attention to the fact that expenditures for labor are made within
ubject to the exchange rates, as are the prices of British goods sold in the
ion is within the country, and to be considered at par. Present exchange
ice of British products in the United States, but only indirectly the rate

res are for chenille rugs and carpets made for

detailed figures could be obtained for chenille
ecifications. It was possible, however, to obtain
npeting qualities from two English factories
y the same price) and one American factory.

Axminster.	American selling price.	English price in America.	
		Normal.[1]	Subnormal.[1]
.....	$10.50	$9.20	$7.18

t $4.8665; subnormal exchange is taken at $3.80 in all these calculations.

rices include the duty of 35 per cent (act of 1913)
eight, insurance, etc.

th the foregoing discussions, a study of costs,
e labor charges between chenille Axminster and
he United States, is pertinent. The data which

follow were submitted by a domestic manufacturer from act records:

Cost of Axminster and chenille Axminster 9 by 12 rugs, April, 1920.

	Axminster specification, 5.56 by 7.	Chenille Axminster specifica jute back, picks in we inch cut, 6 chenille per
Value of worsted yarn in rug	$11.27	$1
Value of jute filler	1.67	
Value of jute stuffer	None.	
Value of cotton warp in rug	1.42	
Value of fine cotton warp in chenille	None.	
Labor cost:		
Weft weaving, direct	None.	
Weft weaving, indirect	None.	
Rug weaving, direct	1.36	
Rug weaving, indirect	.85	
Total cost to weave one rug	2.21	
Total other labor cost	3.09	
Total labor cost in one rug	5.30	
Overhead cost including Federal taxes	1.65	
Total cost one rug, cost including Federal taxes	28.55	
Average weekly wages of experienced weavers	42.00	
Ratio of labor cost to total cost (14) (per cent)	19	

The exhibit is of especial interest in showing the wide rang in the manufacture of different kinds of carpeting. Axminster is more than five times tha Axminster weaving involves a much hi than that of any other domestic product.

Table 2, p. 90 discloses the fact that the percen in Axminster seamless rugs 15.32 per c Axminster seamless 38.01 per cent). differ slightly from those in the manufacturer's exh and 39.5 per cent. respectively. in Axmin seamless rugs. On the basis of dollars t between the actual manufacturer's exhibit) for labor in 1919. The specific figures representative character of the averages use

SECTION 4. FINANCIAL.

1.2493	.6151	.7237	.2391	.5256	.3760

it will be seen that the assets per square yard of the ng ranged in 1919 from $0.615 to $17.535 and in o $19.409; that is, from the mill located in a rented ns and carrying no inventory, to the one which al estate, buildings, and equipment. Assets for ly increased over those for 1915, an increase ranging t to an abnormal 570 per cent.

writing off values for depreciation and obsolescence erity doubtless caused fixed assets (land, buildings, to decline in most instances in the period 1915–1919. ed from 1.36 to 81.18 per cent. Six of the companies in fixed assets; these increases may possibly be e practice of turning increased earnings to plant

s (inventories, cash, accounts and notes receivable, c.) for 1919, in all except two instances, show marked corresponding period for 1915. These increases occur companies reporting and range in percentage from This may be due to any or all of a number of causes, ods of prosperity, increased cost of materials in in- al increase in production and amount of material car- y, need of more cash and extension of more credit, and naterial markets.

ng the foregoing balance sheet figures, due weight the facts that total assets per unit will vary almost lay, that production in practically all cases could be out increasing fixed assets, and therefore fixed asset ould appear to be decreased. This would not hold nt assets, because, in general, increased production n increased inventories, possibly increased cash to ness and increased credit to jobbers to carry stock. certain of the carpet manufacturers produce textiles ool floor coverings, i. e., curtains, table covers, grass jute carpetings.

ows the abnormal increase of 903.16 per cent.

The difference between costs and selling prices is of some signi
cance and, together with balance sheet figures, furnishes eviden
as to the condition of the wool floor-covering industry.

TABLE 7.—*Differences between costs and selling prices, by kinds and forms of carpetings.*

1	2	3	4	5	Per cent of difference betw cost and selling price unit.		
Form.	Kind.	Unit.	Weighted average cost per unit.[1]	Weighted average selling price[1] per unit.	6 High.	7 Low.	8 Avera
Roll goods	Axminster	Running yard of 27 inches width.	$1.7948	$3.5223	111.67	74.06	9

	Tapestry		21.4956	33.9194	75.06	44.01	5

[1] The costs here given are for the last 6 months of 1919, the selling prices are as of June, 1920.

Discrepancies between the figures for weighted average costs in t
above table and those shown in Table 3, pages 91–95, are due to t
omission of certain firms from the compilations in Table 7 because
the lack of complete information on which to base calculatio
Sufficient data were not available to ascertain a weighted avera
cost and selling price for every kind of floor covering.

In drawing conclusions from this table it must be borne in mi
that data from which these figures are tabulated are original; i.
they have not been adjusted, but are the actual figures as furnish
by manufacturers.

Apparently no kind or form of carpeting has the advantage over a
other as regards returns per unit; e. g., roll goods show both t
largest and the smallest return per unit, while neither of the oth
two forms shows any general trend.

Table 8, showing the actual percentage of difference between co
and selling prices per unit, by companies, should be read in conn
tion with Table 7.

s, undivided profits, and reserves for each com- ed by its total square-yard production to deter- olumn 3. While this table (column 4) shows a from a minus 53.74 to a plus 856.60, it should he 12 companies show increases from 24.87 to one the abnormal increase of 856.60 per cent.

These figures clearly indicate that the industry has passed throug
period (1915–1919) of prosperity.[5]

While an increase in surplus, undivided profits, and reserves in
cates that a profit has been made, a decrease in the total of th
accounts does not prove that the business has lost money.
examination of the balance sheets of the two companies which sh
decreases leads to the conclusion either that capital stock w
increased out of surplus, or that production increased over the per
more rapidly than did surplus. A further possibility is that reser
may have been wiped out by replacement of equipment.

It is possible that the companies included could not have distr
uted surpluses as profits—it may have been necessary to put su
funds into the business in order to care for expansion or secure
financial foundations of the organization. The surpluses shown
the table bespeak efficient management and a healthy condition
the business over the period of years considered.

[5] In fairness to the companies whose figures are shown, it should be pointed out that the 1915 figur
doubtless subnormal (compared to a pre-war normal), because of the drain of the preceding lean years
not to the extent that the 1919 figures are abnormal (also compared to a pre-war normal) on account o
and post-war activity. No attempt is made to state what normal is at present.

CHAPTER V.

TARIFF CONSIDERATIONS.

ECTION 1. TARIFF HISTORY.

ating to rugs and carpets in the act of 1913 do ecided changes from the provisions of preceding 1867. In the act of that date Aubusson and ere specifically provided for; chenille was added e act of 1883, and moquette in the act of 1890. or plain" dates from 1890. These phrases have gh the act of 1913. In the act of 1867 provision was made in the phrase "Saxony, Wilton, and ets wrought by the Jacquard machine." This from subsequent tariffs. The phraseology ap- cts to Brussels has the same history—that is, the y the Jacquard machine" is dropped after 1867 in" added in1890. Velvet carpets were specified in the tariff acts of 1867 and 1883 and the phrase added by the act of 1890. The phraseology for as gone through a similar development. Ingrain pecified as two-ply and three-ply throughout the of 1867. The term "yarn Venetian" appears in paragraph in the tariff acts of 1867 and 1883; h the term "wool Dutch." The term "worsted pears in the treble-ingrain paragraph in the acts It was replaced with "all chain Venetian." "Art mentioned in the act of 1890. "Druggets and vided for in the tariffs from 1867 to 1913; the acts added "felt carpeting" in the same paragraph. ls other than wool were provided for in the act of nt acts, the materials named being in each case on; and hemp and jute were provided for in the

covered by three phrases—"carpets woven whole tal, Berlin, and other similar rugs;" and "rugs for appears in the tariff act of 1867. The second phrase e act of 1890 in the same paragraph with "carpets ooms"; it was first split off in 1897, when these ractically their modern form. The term "rugs for st in the act of 1894, and was retained in follow- rlier acts the term "rug" is not so modified.
utline compares provisions made for the various d rugs by the tariff acts from 1867 to 1913.

SECTION 2. TREASURY DECISIONS.

summarizes by tariff paragraphs the construction of the tariff act of 1913 pertinent here.

inster chenille carpeting, 12 by 75 feet, imported in rolls ter importation to meet a particular size demanded , is dutiable under this paragraph and not as "car- voven whole for rooms" under paragraph 300. D. 36216, of 1916; followed in Abstract 40666 of *r carpets woven whole* for rooms and Axminster rugs y classified under paragraph 300. (Abstracts 40666 7.)

ed by the Court of Customs Appeals in 1921, it was ginally there was no such thing as a machine-made carpet, as is shown by a review of the history of ears that at the time of the passage of the tariff act of this country generally and uniformly included in Axminster" both the handmade and the machine-

made Axminster. A review of the history of the subject shows th the word "chenille" was and is commonly and properly used to d tinguish that kind of carpet or rug from all other kinds. No contra commercial designation appears at the time of the enactment of t tariff act of 1913, which was held to differentiate chenille and Axmi ster carpets and rugs, and as chenille rugs are made from portions chenille carpets or carpeting and are not enumerated in paragraph 3 they were held to be properly dutiable under paragraph 293, by virt of paragraph 303. (United States *v.* Trorlicht, 10 Ct. Cust. Appls., 2 of 1921, followed in Abstracts 44262, 44290, 44444, 44454, 444 44611, 44625, 44648 of 1921, 44746, 44908, 44964, 45025, 450 45083, 45316 of 1922, and numerous other abstracts.

Par. 294. Seamless Wilton rugs, machine-made, are dutiable un this paragraph by virtue of paragraph 303 and not under the pr sion of paragraph 300 for "Oriental, Berlin, Aubusson, Axmins and similar rugs" (Beuttell *v.* United States, 7 Ct. Cust. Appls., 3 of 1916; United States *v.* Fenton, 8 Ct. Cust. Appls., 239; Uni States *v.* Carson, 8 Ct. Cust. Appls., 240; Beuttell *v.* United State Ct. Cust. Appls., 409, of 1918; followed in Abstract 44595; Beuttel United States, 9 Ct. Cust. Appls., 38, of 1919), nor under paragr 300 as "carpets * * * woven whole for rooms" (United State Snellenburg, 9 Ct. Cust. Appls., 59, of 1919).

Par. 297. Tapestry Brussels rugs, machine-made, are dutia under this paragraph by virtue of paragraph 303, and not under provision in paragraph 300 for "Oriental, Berlin, Aubusson, minster, and similar rugs." (7 Ct. Cust. Appls., 356, supra.)

Par. 300. This paragraph relates to *rugs* that are *handmade hand tufted,* and to machine made Axminster. (7 Ct. Cust. App 356; 8 Ct. Cust. Appls., 239, 240, 409, 428; and 9 Ct. Cust. App 38, supra.) *Axminister rugs*, machine-made, are dutiable eo nom under this paragraph. Though formerly Axminster rugs were ha made, the evidence is to the effect that the term "Axminster" generally and commonly understood to cover and include the machi made product as well as the handmade, and that the handmade art constitutes but a small part of the commerce in Axminster r (8 Ct. Cust. Appls., 409, supra; United States *v.* Gertzen Co., 8 Cust. Appls., 428, of 1918, see United States *v.* Vandegrift, 11 Cust. Appls., ——; T. D. 39192 of 1922.) *Rugs* imported from Jap found to be composed of *cotton, jute,* and *cattle hair*, cattle hai chief value, there being no evidence from which to determine whet they are handmade or hand tufted, were held dutiable under this pa graph. (Abstract 42280 of 1918.) The provision in paragraph 300 "*carpets * * * woven whole for rooms*" does not include all r which are woven whole, nor can the question whether or not a is classable under this paragraph be determined by the size of rug. It refers to a carpet which has been specially woven for a p ticular room. (9 Ct. Cust. Appls., 59, supra.) *Samples of r* showing qualities and patterns from which to take orders and to disposed of at a comparatively small price, having a commer value, were held dutiable under this paragraph. (Abstract 3953 1916.) Chinese rugs, handmade and hand tufted, and of orie design, were held dutiable at 50 per cent ad valorem under paragr 300 as oriental or similar rugs and not under paragraph 293 at per cent. (Abstract 45161 of 1922.)

Green baize wool cloth, 36 to 72 inches wide and about 30 claimed dutiable under this paragraph, was held dutiable th under paragraph 288, the testimony being insufficient a commercial definition of the term "bockings." (Ab- 3 of 1916.)

Sundour rugs, found to be used as floor coverings, were le as rugs of cotton under this paragraph rather than as mats under paragraph 264. (Abstract 37303 of 1915, Abstract 38314 of 1915.) Under date of August 5, 1922, he Treasury Department, in harmony with T. D. 28637 36551, issued instructions to the customs officers that ndour rugs, jacquard figured, and composed in chief ton chenille, were to be assessed with duty at the rate of ad valorem under provisions of paragraph 258 of the f 1913. (T. D. 39224.). Cotton rugs made with a ve invoiced as "washable cotton bath mats" were found hin the ordinary meaning of the term "rugs," the evidence t they are known in the trade as bath rugs rather than ts, and were held dutiable under this paragraph rather aph 264. (Abstract 38503 of 1915; followed in Abstract 16 and Abstract 44882 of 1922.)

le of straw and cotton, the straw composing the weft and the warp, which latter, thickened in places to form a design, were held properly dutiable under the provision h 272 of the act of 1913 for "rugs manufactured from l, and having a warp of cotton" rather than as "rugs of ler paragraph 302. (G. A. 8384, T. D. 38525, of 1920; Abstracts 44159, 44249, and 44667 of 1921.)

Rugs, made up of carpets or carpeting, were held dutiable ppropriate paragraph for carpeting rather than under 91 of the act of 1909 or 300 of the act of 1913. (G. A. 34816, of 1914, and T. D. 35062 of 1915.)

chenille rugs.—Certain Axminster chenille rugs were within paragraphs 293 and 303 of the act of 1913, which er Axminster chenille rugs, rather than within paragraph inster rugs. (G. A. 3814, T. D. 38236, of 1920; affirmed, s *v.* Trorlicht, 10 Ct. Cust. Appls., 254, of 1921.) Rugs nning lengths of 50 to 100 yards, which running lengths are cut at a point indicated by the design into separate npleted by binding the ends, were held to be dutiable raph 293 by virtue of paragraph 303 and not under 00. The court said that if it be shown that rugs are ortions of carpets or carpeting, then by virtue of para- ey are subject to the rate of duty imposed by the tariff ts or carpeting of like character or description in para- (United States *v.* Vandegrift, 11 Ct. Cust. Appls., —; of 1922. Petition for a rehearing denied, 11 Ct. Cust. D. 39192; followed in Abstracts 45382, 45501.)

SECTION 3. ADVANTAGES AND DISADVANTAGES OF THE AMERIC MANUFACTURER.

(A) MACHINE-MADE CARPETINGS.

The position of the American carpet industry in world trade been covered in detail in the preceding pages of the report. T section will present only a general summary of what has gone bef

The United States is by far the largest producer of rugs and car in the world, and provides a home market of a much greater consum power than that of any other nation. She differs markedly from nearest competitor, Great Britain, in being to a very much less ex a trader in carpets and rugs with other countries, whether of dom or of foreign manufacture. Although exports have bulked ra large, those to individual foreign countries have never taken on steady character which indicates a well-developed foreign marke

Size, length of establishment of the industry and the resul financial strength, the development of mechanism in advance of which has taken place in other countries, all represent distinct ad tages for the domestic manufacturer over those of other count To these advantages accruing from the development of the indu may be added the consuming power of the domestic market, w has furnished opportunity to the domestic producer, at the same that the tariff has hindered attempts on the part of foreign ma farmers to take advantage of it. The advantage which the la scale manufacturer has in comparison with the small is one posse in general by the American industry, much of the product of whic made by firms of outstanding size.

A factor of importance to the American maker has been his adv tage in meeting and developing the taste of the domestic marke [illegible] meet vigorously the conditions arising from the unpopula of their product. even for them it may be said that the necessit change has resulted in a shift from wool to fiber (paper) and wool fiber carpetings. a kind of floor covering which has found fa with the public. There has been a similar change in taste in increasing preference for rugs to carpets, and the manufactu have turned their attention vigorously to the development of production. Progress has been indicated by the increased efficie of rug looms, relative to the carpet looms, the decreasing average of the more popular product. and the more pronounced price dec which this form was subject to after July, 1920.

[illegible] of production, so far as indicated by the information avail the Tariff Commission, is greater in the United States than in G [illegible] while the hours of labor (48) are the same for these [illegible] and also for Germany (by general law).

The [illegible] advantages under which American industry labors are c [illegible]. The most obvious of these, and that which is attracting [illegible] as an element in the general commercial situatio [illegible] of exchange, which tends to give the impo a [illegible] advantage in the domestic market. The price fig [illegible] have been presented show the situation at par exch [illegible] Britain and the United States; with the British po [illegible] for a long period fully one-fourth and even now by

r one-tenth, the advantage of the British producers is

ıange situation is a temporary one, in the sense that ıt, however slow, may be expected ultimately to do away equalities existing at the present day. The permanent which both the British and the continental industries the lower wage scale of the European worker. The which has been presented, showing differences between American weaving rates, indicates that wage differences the different types of fabrics. On Brussels, for in- r as weavers are concerned, the figures indicate a higher British, while for Wiltons the American weaving rates 3ritish by a large percentage. For the other types of igures indicate that the British wages are the lower, but ;e amount. The use of two looms to one weaver in the ı for Axminster and tapestry results in a lower rate here. ition between countries with differing wage scales, the the lower has a greater advantage in those articles in which the labor forms the larger percentage. In the pet industry, this percentage is highest for chenille r which it amounted to 38 per cent during the last six 19. The imitation oriental stands in the same class; nas are left out of consideration because of their small ıd the lack of foreign production, come Wiltons, show- ately 21 per cent, though seamless rugs (a specialty 28 per cent. Tapestry, velvet, and Axminster (except med rugs) show a distinctly lower percentage of labor gures which have been presented for Brussels seamed nall percentage of labor costs—comparable to that for mentioned types of carpetings—but it is not believed of a sufficiently comprehensive nature to indicate the ussels rugs, and more general considerations would ı nearer Wilton fabrics.

Axminster the advantage to foreign goods evident from abor cost is not subject to any marked compensating ıer than the vigorous growth which has taken place an industry under war conditions. The British— ıtch firm—have applied much effort to the production n of this fabric, and have gained market, reputation, ages of large-scale production. In Great Britain, to t than is true in the United States, this fabric has lard type of floor covering. In the production of ons are largely reversed; American effort has been s this product, as British toward chenille Axminster, is in general demand in the market, while the chenille very much more restricted demand. Both of these rted; for Wiltons it may be stated that a quality has ı the United States that the foreign producer finds

(B) HANDMADE CARPETING.

ıre of carpeting by hand has been attempted in this attempt was not successful. Only a low standard illingness to undertake the tedious labor involved,

would make possible production able to meet competition from oriental, or, in fact, from the European product. The pre machine-made product, reproducing faithfully the Sehna we sells at a price below the general level of prices for fine orie products, though well above other machine products, with exception of some chenille Axminsters. In competition with orien its disadvantage lies simply in the fact that it is a machine prod and thus lacks the artistic and individual character of the handm rug; and it is this characteristic which to a great extent account the market found by the latter in the United States. Sale for European hand-tufted goods is found because of their high qua from the point of view both of artistic merit and workmanship latter assuring good wearing quality). The price obtained sta them clearly as articles of luxury. An exception to the gene noncompetitive position of these products may be found in their in hotels, in so far as such use is dependent upon the considera that the investment in the higher priced article will mean gre return on account of its greater durability. A final considera regarding handmade products is that although they comprise 80 per cent of the imports and hence are of great importance from point of view of the tariff, they form only a small proportion of total value of the domestic trade in wool rugs and carpets, a corresponding less proportion of the floor space covered by t articles.

Section 4. Classification and Duties.

(a) classification.

The analysis of carpetings according as they are hand or mach made, or belong to the different types or forms, which runs through this report, and on which the cost study was based, was adopted v the view of its possible application to classification of these prod in the tariff. General competitive conditions have been indic in accordance with this arrangement, and the cost survey has b undertaken to establish American costs, as far as possible, for typical machine-made goods of the various classifications, as a g to their relative competitive position and thus to the fixing of ra A recapitulation of the distinctions made follows, with conclus as to the feasibility of its application to tariff classification and ra

Handmade versus machine-made.—The most general distinc to be drawn between wool rugs and carpets is that differentia the hand from the machine product. Technically, it is a ques of whether or not the power loom was used in the production of fabric. The hand loom is to-day virtually nonexistent in the Am can carpet industry. In competitive position, hand and mac products rest on a very different basis; the profitable productio handmade carpetings in the United States is not possible, and t is no hand industry with which that of the Orient or Europe c petes, while the American machine industry is the largest in world, and meets competition of European machine-made goo although such goods do not form a large factor on the mar From the fiscal point of view, the two classes of products are q distinct: The first is, in general, a noncompetitive, luxury produ the imports of which would not be greatly affected by the height the duty, and a duty on which is therefore to be regarded as a sou

the second is a competitive product, and the duty may as protective as well as a source of revenue.

abrics.—Within the machine-made fabrics, division has etween the different types—that is, between the different which the different carpets derive their names. Here ns are clear;[1] in fact, probably clearer than for any product. In costs and prices these different fabrics or less distinct classes, though it is to be noted that the etween Axminster, tapestry, and velvet are less than n and the other types. Two types differ markedly The product made on the power loom which imitates riental weave has only recently been marketed, and ed at a relatively high labor cost. This loom is open n from looms established abroad to produce the same econd of these types is chenille Axminster, which also labor costs, and in which the long-established British s active competition. The statement[2] just made ages of labor cost involved in the production of the is indicative of the difference in competitive position pes.

classification used in this report has involved not only between the hand and machine product and the of fabrics, but also between the different forms—ed rugs, seamless rugs. The results of the cost study his distinction between forms for fabrics produced s are presented on pages 91 to 95. For tapestry the es indicate an additional cost, for seamless rugs, of er cent. For the other fabrics the variations are so ent further generalization of this kind. For velvet gs than for carpets appears in four out of the eight nd in one out of the three given for seamless Ax- t such differences are extremely slight, and can not ignificant. It can not be said that there has been r the excess cost of rugs to have become less or ne five-year period shown; in some cases it has in- s decreased.

the unsatisfactory nature of these figures is felt to at roll goods and rugs, both of the standard speci- e rarely made in the same mill. The decline of l goods has also been a factor, as has the lack of ns designed for or fitted to show by what amount st per square yard of a rug exceeds the production rd of roll goods of the same type and specifications. how as great variation between carpets and rugs

igures, in so far as available, thus give no basis for percentage by which cost or prices for rugs, either s, exceeds that of roll goods of the same type and neral considerations indicate such a difference an the figures themselves. From such considera- variation would be expected for chenille Ax-

[1] ain velvet are identical fabrics; so also one-frame Brussels and plain tapestry; to each is not clear.

minster,[3] and less variation in the case of velvet and tapestry tha in the case of the other types except chenille.

(B) TARIFF PHRASEOLOGY.

The tariff classification provided for by the act of 1913 for carpet and rugs is to be considered in the light of the analysis which th report has followed. Several points, however, are involved in th phraseology of the tariff paragraphs which have not been touche in the summary immediately preceding. Among them is the fa that 11 out of 25 paragraphs of Schedule K were devoted to carpe ings, and 2 of the remaining 14 paragraphs defined wool and ga the date on which the schedule went into effect. Under the act 1922 carpets and rugs are covered in these paragraphs.

For the fiscal year 1920 imports of carpetings made up only 2 per cent of the value of all articles entered under this schedule. fact, machine-made carpeting, to which the great bulk of the carp paragraphs was devoted, formed a negligible percentage of impo under Schedule K of the act of 1913.

Some terms have become obsolete. They are:

"Moquette," which is the French word for Wilton, and which is n now applied to machine-made products in the United States, thou at one time it was applied to a type of Axminster.

"Saxony," which signifies a wool Wilton.

"Tournay velvet," which is a kind of velvet carpeting.

"All-chain Venetian," and "wool Dutch," products of the ingr type, of no importance to-day.

"Bockings," "covers," and "bed sides," are products of no pr ent importance.

The following groupings, used in the act of 1922, omit obsol terms and bring together or separate the several kinds of floor cov ings which the decisions and the facts show might well be combi or separated, as the case may be:

1. Oriental, Axminster, Savonnerie, Aubusson, and other carpets and rugs, made on a power-driven loom; * * *. (Par. 1116.)

This brings together all handmade carpets and rugs and ad Savonnerie, which is a term applied to a French hand-tufted prod more extensively imported than some of the others hitherto provid for by name.

2. * * * carpets and rugs of oriental weave or weaves, produced on a po driven loom; chenille Axminster carpets and rugs, whether woven as separate car and rugs or in rolls or any width; all the foregoing, plain or figured, * * *. (P 1116.)

This provides for carpets and rugs woven on power looms wh reproduce the oriental weave. Chenille Axminsters are also inclu in this group because they are power-loom products which entai considerable amount of hand work and which carry a high percenta of labor cost.

3. Axminster carpets and rugs, not specially provided for; Wilton carpets and r Brussels carpets and rugs; velvet and tapestry carpets and rugs; and carpets and r of like character or description, * * *. (Par. 1117.)

[3] One manufacturer estimates that the cost of seamless chenille Axminster rugs would exceed th roll goods of corresponding quality by perhaps 9 or 10 per cent.

ping covers all other machine-made wool carpets and ingrains which are of a somewhat different class and, e now usually made in the United States of other mate- ol.

pets and ingrain rugs or art squares, of whatever material composed, rugs of like character or description, not specially provided for, 1117.)

ain carpetings are differentiated in method of manufac- now usually in material from the regular standard wool ted in group 3.

or coverings, including mats and druggets, not specially provided olly or in chief value of wool, * * *. (Par. 1117.)

sket clause that covers not only mats and druggets but r type of wool carpeting that might not properly be any of the groups more specifically described.

ocks, and all other articles composed wholly or in part of carpets or ially provided for, * * *. (Par. 1118.)

rugs are not infrequently used in making other articles. ssocks are mentioned specifically only as an indication this group (par. 1118) which includes all articles, not led, made in whole or in part from carpets or rugs.

(C) SPECIFIC DUTIES.

rugs are provided for at ad valorem rates in the act also the case in the act of 1913; in the preceding two compound duties. A summary of the duties on the carpetings has been presented on preceding pages of

n of specific duties would raise the question of dis- rugs and carpets in a more pronounced form than n duties. Under an ad valorem system the higher sults in the higher duty upon rugs. The compound d 1909 resulted also in a heavier rate for rugs, although han under an ad valorem system.

he acts of 1913, 1909, and 1897 have been applied es of domestic carpeting, as previously presented, duties are computed and presented in the following pose of showing differences in the rates levied upon carpeting by the acts mentioned. In reading the ept in mind that the prices used are domestic, and e high prices of June, 1920. Under high prices the ts of the ad valorem duties or compound duties r for rugs and carpets by a greater amount than —that is, if the prices per square yard of a carpet nd $2, respectively, and the duty 50 per cent, the pecific equivalent of the duty will be $0.50, while h are doubled, the difference between the specific same rate will be $1. Likewise, under high prices, tween the specific equivalents of the compound cts of 1909 and 1897 and the act of 1913 will be greater weight of the ad valorem portion of the

Ad valorem and specific rates of duty on carpets and rugs on the basis of typical prices June, 1920.[1]

[Acts of 1913, 1909, and 1897.]

ROLL GOODS.

Description.	Domestic price per square yard of typical fabric.	Duties.			
		Act of 1913.		Acts of 1909 and 1897.

[1] The fiscal year 1891 does not include 32,671,469 pounds, valued at $3,721,689, paying duty amounting to $976,864, which came in under the old law effective July 1, 1883, to Oct. 5, 1890.
[2] Includes 144,227 pounds of "Hair of the goat, alpaca, and other like animals," valued at $30,569 (free).
[3] Includes 210,034 pounds of "Hair of the goat, alpaca, and other like animals," valued at $37,477 (free).
[4] Includes 97,173 pounds of "Hair of the goat, alpaca, and other like animals," valued at $16,360 (free).
[5] A portion of the imports for 1910 were not assignable to either the old or the new tariffs by reason of any difference in rates of duty, and were therefore distributed between the old and the new on the basis of the proportionate days covered by each.

General imports of Class III wool, 1891–1921.

War Commodities: 1918. Production in that census was given in linear yards. into square yards on the assumption that all carpetings were reported as of in, in which branch the 36-inch width is universal. Some inaccuracy unecially with regard to Axminster and Smyrna figures, since in the chenille les it is customary to deal on the square-yard basis, and it is uncertain in just irers of these goods converted their productions to "linear yard" basis.

c production by several forms of manufacture, 1919 and 1914.

Putting in name or trade-mark shall be paid 1 hour.		
Putting leathers on frames, hour work.		
When a weaver goes on a loom which has been standing for some time and any or all yarn has been taken out of the loom, he shall be paid full price for altering.		
5 small rugs of any size shall be called an order, and shall not call for payment for the changing of cards.		
2-4-6 by 7-6 rugs also as the above.		
Putting in the warp equals one frame of altering.		
Changing the cylinders to be paid 1 hour.		
Putting on false reed, each time 1 hour.		
Changing fine chain on reed	[3] 1	
Cutting down and drawing up odd courses to be paid for at the rate of 8 courses the hour, but not less than 1 hour to be paid.		
Margins: Owing to varying conditions, the payment for marging will be left to each local making same.		
All hour work to be paid, per hour		.
Experimental work to be paid, per hour		.
Fixers: The minimum wage of the fixers shall be, per week		58.
Hours: The working hours shall be 48 hours per week.		
Alterations:		
Altering up to 256-pitch	$0.8414	1.
Chintz frames, 4 or more colors	1.1149	1.
344-pitch	1.4305	1.
Chintz, 4 or more colors	1.9072	2.
Drawing up frame equals 1 frame altering.		
Breaking in frame without boy equals 1 frame altering.		
Tying through frame equals one-half frame for each frame tied through.		
Small alterations:		
Up to 45 bobbins	[4] ¾	
46 to 90 bobbins	[4] ⅞	
91 to 135 bobbins	[4] 1	
Over 135 bobbins	[4] 1	
Up to 60 bobbins		
61 to 120 bobbins		
121 to 180 bobbins		
Over 180 bobbins		
Chains and reeds:		
Fine chain	.6311	.
Single jute stuffer	.6311	.
Double jute stuffer	.8414	1.
3-ply jute stuffer	1.1570	1.
When stuffer works inside of loom add one-third above prices.		
Fine chains D type Dobcross looms to be paid one-third more.		
Tying in beam without boy, when ordered by foreman, equals 2 beams.		
Taking out beam, including lace, equals one-half hour.		
When lace has to be picked, half hour extra.		
Changing footwork	2.1057	2.
Drawing reed	.8414	1.
Piecing back:		
344-pitch (one quality), up to 3 yards	2.1057	2.
For each yard or fraction over 3 yards	.4207	
344-pitch (second quality), up to 3 yards	1.8853	2.
For each yard or fraction over 3 yards	.4207	
All Wiltons up to 256-pitch, including wool up to 3 yards	1.6519	1.
For each yard or fraction over 3 yards	.2882	
Brussels up to 4½ yards	1.6518	1.
For each yard or fraction thereof over 4½ yards	.2185	
Planted frames, consisting of 4 or more colors or over, to be paid one-third or over above prices in their respective grades.		

[3] Hours. [4] Frame.

APPENDIX I.

Illustrations of construction details of various types of wool rugs.

(Selected from returns submitted to Tariff Commission.)

Type of rug.	Yarn.	Yarn count.	Pounds of yarn per rug 9 by 12 feet.
Chenille Axminster:			
Sample No. 1	Woolen (filling)	25 yds. per oz	29.61
	Woolen (chenille)	58 yds. per oz	21.52
	Cotton (binding warp)	9/4	3.95
	Cotton (selvage)	20/3	.44
	Cotton (for the chenille)	24/3	2.17
		50/3	.86
	Jute (stuffer warp)	12-lb	8.37
			66.92
Sample No. 2	Woolen (backing)	20 yds. per oz	37.28
	Woolen (chenille)	45-yd./3 p'y	32.31
	Cotton (warp for making the chenille; also used to bind the chenille yarn to the wool back).	30/3	1.75
	Cotton (for chenille)	40/3	1.62
	Cotton (warp)	9/4	3.47
	Linen (selvage)	30 lea, 3 ply	.32
	Jute (stuffer warp)	10-lb	6.65
			83.40
Smyrna	Woolen (chenille)	10 cut/9 ply	25.50
	Cotton (warp)	11/5	2.25
	Jute (filling)	17-lb./7 ply	20.00
			47.75
Axminster:			
Sample No. 1	Woolen (face)	60 yds. per oz	15.42
	Cotton (warp)	9/3	5.52
	Jute (filling)	13-lb	4.11
			25.05
Sample No. 2	Woolen (face)	35 yds. per oz	13.47
	Cotton (warp)	12/3	4.05
	Jute (filling)	14½-lb	13.86
			31.38
Sample No. 3	Woolen (face)	54 yds. per oz	18.67
	Cotton (warp)	8/3	5.81
	Jute (filling)	13-lb	14.54
			39.02
Wool wilton:			
Sample No. 1	Woolen (pile)	2-run/3 ply	28.99
	Cotton (filling and chain warp)	8/3	10.76
	Jute (stuffer warp)	14-lb	6.75
			46.50
Sample No. 2	Woolen (pile)	72 yds. per oz./3 ply	23.93
	Linen (filling)	5½ lea	5.22
	Cotton (chain warp)	8/3	5.58
	Jute (stuffer warp)	14-lb	8.38
			43.11
Worsted Wilton:			
Sample No. 1	Worsted (pile)	12/2/2	27.74
	Cotton (chain warp and stuffer warp)	8/3	10.44
	Cotton (filling)	8/4	11.19
			49.37
Sample No. 2	Worsted (pile)	16/2/3	34.95
	Cotton (filling)	10/5	5.85
	Cotton (chain)	8/4	7.25
	Cotton (stuffer)	8/4	3.49
			51.54

construction details of various types of wool rugs—Continued.

Yarn.	Yarn count.	Pounds of yarn per rug 9 by 12 feet.
Worsted (pile)	17/3	17.33
Linen (filling)	6 lea	5.13
Cotton (chain warp)	8/3	5.25
Jute (stuffer warp)	15-lb	4.18
		31.89
Worsted (pile)	17/2 ply/3 cable	17.25
Linen (filling)	5½ lea	4.50
Cotton (chain warp)	8/3	4.50
Jute (stuffer warp)	16-lb	4.01
		30.26
Woolen (pile)	58 yds. per oz	7.10
Cotton (chain warp)	9/3	2.73
Jute (filling)	9-lb	4.73
Jute (stuffer)	16-lb	9.28
		23.84
Woolen (pile)	30 yds. per oz./3 ply	10.70
Cotton (chain warp)	9/4	3.57
Jute (filling)	14-lb	6.83
Jute (stuffer)	15-lb	11.90
		33.00
Woolen (pile)	38 yds. per oz./3 ply	8.11
Cotton (chain warp)	8/3	2.58
Jute (filling)	10-lb	3.97
Jute (stuffer)	16-lb	9.01
		23.67
Worsted (pile)	12½/2 ply/3 cable	4.37
Linen (filling)	6 lea	3.54
Cotton (chain warp)	9/3	3.01

PREFACE.

f a series of tariff information surveys prepared by
ɔes Tariff Commission and transmitted to the Com-
and Means. The series covers all of the articles and
ɔvided for in the tariff act of October 3, 1913, and
fically provided for. It is arranged in the numerical
ıphs of that act.
; two or more paragraphs have been combined in one
doing this, industrial relationship of the articles has
'hen possible. In those instances where a paragraph
ed under a preceding paragraph of the tariff act,
ıde to this fact at the point where the paragraph
ɛrical order. Where one grade of an article is dutiable
ıde of the same article is on the free list, the article
der the dutiable paragraph, which appears first in
r in the tariff act. In certain instances articles of
relationship and which occur in separate paragraphs
t have been combined under one paragraph for con-
ɔussion. Reference is made to this fact at the point
nodities would naturally occur in numerical order.
ıphlet in the series is an "Introduction and Index,"

uctory chapter discussing the scope of the series and
ɔhod of treatment.
ɔetical index of the articles provided for in the tariff
owing the paragraph of the act in which the article
ɔr and, if discussed under a different paragraph, the
ı paragraph.
the pamphlets in the series, showing the paragraphs
luded in each pamphlet.
use of this "Introduction and index" the exact loca-
cussion relating to a given article or commodity can

ɹration of this report the Tariff Commission has had
Evelina P. Kean, of the textile division of the com-
and of others.

finish and weight they resemble a woven cloth they are sold by the same name.

Knit goods differ primarily in construction from woven fabrics in being made of one thread or one series of threads traversing the fabric in one direction, either across the fabric, which is weft knitting, or endwise of the fabric, which is warp knitting. The structure of the fabric in either case is made up of connecting loops formed on needles. Weft-knit fabric is made from one or more weft threads traveling from needle to needle, forming adjacent loops and returning another series of loops. Each row of loops across the width of the fabric forms a course, each row in the length a wale. Warp fabrics are knit from any number of threads arranged on a beam as are the warp threads for a woven fabric, but instead of the texture being built up by the crossing and recrossing of another series of threads the warp threads only, running longitudinally, make up the knitted fabric. If one needle were to operate continuously on the same warp thread a number of chains would be formed, but each thread is controlled by a guide which lifts it back and forth from one needle to another, interlocking the loops of the different threads in such a manner that a continuous fabric results. It will be seen that color variation in weft fabrics can most easily be secured by introducing the different yarns in the formation of the length to produce horizontal stripes. In warp-knitted fabrics an indefinite number of color combinations are possible by the distribution of the yarns on the warp beam which will effect stripes longitudinally. Further designs can be attained by changes in the manner of shifting the threads from needle to needle.

The texture and appearance of knit fabrics can be considerably changed by stitch selection and stitch formation. There are three general types of weft-knit fabrics—(1) plain, (2) ribbed, (3) purled. In a plain weft-knit fabric the sides of the loops all lie on the face of the fabric, giving the lined appearance of the wales, and the loop ends all lie on the back of the fabric. Two sets of needles, operating in different planes and so forming loops on opposite sides of the fabric, produce an emphasized appearance of the wales or groups of wales, which because of this prominence are called *ribs*. Some of the ribs appear on the face of the fabric and some on the back, according to the number of needles in each plane. If one wale appears alternately on the face of the fabric with one on the reverse, the fabric is known as a 1 and 1 rib. The number of wales showing on either side of the fabric may be grouped, as, for example, 2 on one side and 1 on the other, or 5 on one side and 3 on the other, forming, respectively, a 2 and 1 and a 5 and 3 rib. Purling or pearling is effected by reversing consecutive stitches in a course, so that loops which would normally appear upon one side of the fabric will occur upon the other. If a fabric be purled at alternate courses, raised lines will appear running horizontally. As the greatest contraction is in the length, so the greatest elasticity is in that direction, just opposite from that of ribbed fabrics.

These three types of fabrics, plain, ribbed, and purled, may be modified by the use of different kinds of stitches. One of the most frequently seen is the tuck stitch, which is formed by the retention of one or more loops in the needle before the completion of the stitch. This results in greater prominence at the stitches tucked, giving

ınd bulk. Tucking is therefore used not only for
ıable but also where a greater stretch or a heavier
An extra bulk is obtained by applying the tuck
bing process. The *cardigan* rib is the alternating
ς stitches on both the ribs of the face and the ribs
.e fabric. The *half cardigan* or royal rib is formed
ɜeries of ribs plain and the other series alternately
. These stitches are so frequently used for heavy
t "cardigan jacket" has become a common term.
rics may be divided into two general classes[1]
and (2) open fabrics. *Close fabrics*, as the term
in which the loops are intimately interwoven, giving
e. The increased thickness as obtained by ribbing
reft-knitted fabrics may be imparted by knitting
warp threads simultaneously, whereby a fabric of
is secured. An *open fabric* is one in which the warp
ted at intervals only. Warp-knit fabrics vary in
heaviest overcoatings to the most diaphanous nets.
ıst unique characteristic of weft-knitted fabric, its
h, while making it unsuitable for some purposes
ıdapts it to others, most especially for clothing to be
ly, where a smooth, snug fit is desirable. The tensile
p-knitted fabrics lie midway between those of weft
woven fabrics. Because of the sidewise interlocking
warp-knit fabric, it is much less elastic on the width
ıbrics; hence not as suited to use for close-fitting
ɔut more useful for outerwear. These fabrics are
but the stretch is less excessive than in weft-knitted
ɐqual as to length and width. They are particularly
es, allowing a slight conformity to the shape of the
ıger of undue bagginess in the article. Warp-knit
. used in making cotton gloves. For gloves cut
ric, jersey cloth made on weft machines is very
ɔol has more natural elasticity than cotton and will
shape to which stretched.

mpeting articles.—Where woolen knit fabrics are used
hey encounter, to some extent, competition from
t apparently this competition is not very serious, as
ar can be made to fit better and is more comfortable,
readily with the movement of the body. Warp-
ve much the same uses as woven fabrics, and when
lar material and weight they will be competitive.
and heavy woven coatings are more and more being
-knit fabrics. For coatings the warp-knit fabrics
ıpped so that the loop formation is not apparent.
and weft-knit fabrics are somewhat competitive as
weft-knit jerseys which are used for suits and dresses
ght jerseys used for gloves.

DOMESTIC PRODUCTION.

rsted, cashmere and botany, and what is
are used in making wool knit fabrics.

p. 120.

WOOL KNIT GOODS.

WOOL KNIT FABRICS.

SUMMARY.

ugh the knit goods industry is one of the oldest in the country
of knit fabrics in a similar manner to woven fabrics is so recent
ctically an entire new line of manufacture has been estab-
line which is as yet only in its infancy. The popularity of
ric has increased to such an extent that it is now consid-
ndard for ready-to-wear clothing and even for the use of
istress. There is undeniably a big future in knit fabric as
son brings out new types which adequately replace similar
brics.

oduction of such knit fabric is not as yet definitely estab-
the United States as a distinct branch of the knit goods
Most frequently wool fabrics are made by small concerns
it other wool goods. One or two large concerns have
nterested in the piece goods trade.

e most part these fabrics are sold to the "cutting up"
at is to the manufacturers of ready-to-wear garments,
women's suits, coats and dresses and men's overcoats.
it fabric is, however, becoming an ever-increasing factor
rade, the very great width in which it is obtainable making
lly economical for cutting garments for which large pieces
ed.

y is the principal foreign producer of wool knit fabrics,
to 1914 made goods of this character in larger quantities
other country.

e increased demand and the curtailment of the German
gland, like the United States, has undertaken the manu-
wool knit fabric.

are not now large, but may well increase when commerce
moves more regularly, for the United States offers a good
wool knit fabrics.

GENERAL INFORMATION.

TARIFF ACT OF OCTOBER 3, 1913.

* * knit fabrics, * * * wholly or in chief value of wool, not
ided for in this section, 35 per centum ad valorem; * * *.

DESCRIPTION.

—Jersey is a term applied to a number of knitted fabrics
tly in texture. As a rule, however, it means to the aver-
a rather finely knit fabric suitable for dresses and, in
ghts, for suits and coats. No very definite names have
given the different knit fabrics, and frequently where in

IMPORTS.

Prior to the tariff act of 1897 imports were variable, increasing and decreasing with the change in tariff rates. During the operation of the acts of 1897 and 1909, which were identical with regard to wool knit fabrics, imports were of inconsequential amounts. The act of 1913 apparently relieved the duty, but there was no adequate opportunity to observe the effects which its reduction would have in normal times. The highest valuation of wool knit fabrics imported in the 21 years 1897–1917 was $12,181 in 1920, in which year the equivalent ad valorem rate amounted to 45.13 per cent. The act of 1894 considerably reduced the duty, and by levying only an ad valorem duty made the importation of cheaper grades of fabric more profitable. The goods imported increased from 11,535 in 1895 to 1,817,943 in 1896. A comparison of values for these two years shows a smaller increase. The goods imported in 1893 had an average value of $1.36 per pound, as compared with $0.38 per pound for the imports of 1896. In the first year the duties collected amounted to 32.25 per cent of the value and in the second year to 76.09 per cent of the value. The tariffs of 1897 and 1909 which levied the same rates of duty were practically prohibitory, the total imports for the 16 years and 2 months during which these acts were in force amounting to only 162,674 pounds, valued at $183,495, while 1,817,943 pounds, valued at $623,738 were imported during the one fiscal year 1897. The revenue feature of these tariff acts is also significant; $50,642 more duty was collected in the year 1897 at a rate of 35.81 per cent than in the 16 years and 2 months at an average rate of 94.17 per cent. Imports under the act of 1913 were small, the highest value being $12,181 in 1920 and the greatest quantity 5,216 pounds in 1919. There has been no marked tendency toward increased importation. Imports in 1919 were less than one-tenth of 1 per cent of domestic production.

COMPETITIVE CONDITIONS.

One of the most important considerations in the competitive manufacture of wool knit fabrics is the availability and cost of raw material. The manufacturing cost, exclusive of material, varies considerably with the kinds of fabric. The cost of material in ordinary jersey cloth made on circular machines would be greater than the cost of labor, but where more intricate machines and more elaborate designs are employed the labor cost would be in increasing proportions. Hence any factors which increase the cost of wool add materially to the burden of the manufacturer of the cheaper grades of wool fabric. Manufacturers of such goods are probably as well equipped as makers of the same goods in foreign countries; but German manufacturers probably have some advantage in equipment for flat knitting, especially warp knitting, machines. As these have not long been built or even used in the United States, the American manufacturer installed machinery at a time of exceptionally high costs, whereas the German manufacturers bought their equipment at very much lower prices.

WOOL HOSIERY.

SUMMARY.

The demand for wool hosiery in the United States is less stable than at for cotton or silk; consequently there is a greater element of risk its manufacture, a risk which does not bear equally upon the foreign oducer, as north European countries afford a constant market. ie manufacture of wool hosiery, seldom undertaken as an independ- t enterprise, is frequently combined with the manufacture of cotton silk hosiery or other lines of wool knit goods.

The total output of wool hosiery in the United States in 1914—240,000 dozen pairs, four-fifths of which was wool mixed—nounted to 6 per cent of all the hosiery made in the country during

·. Imports of wool hosiery in 1921, though almost 6 times rt for the first full year of record (1915), are still only about t of the quantity produced in 1919.

ool hosiery industry is old and well established in Great he large home demand and the advantages of colonial prefer- iffs giving the British manufacturer a wide market. With mportation of raw wool into the United States the American can obtain his material on an equal basis with the foreigner, though about four-fifths of the wool used in the knit-goods in the United States is of domestic origin a duty on the raw ls to increase prices and places the domestic manufacturer at ıntage.

e of wool hosiery has increased in the last few years, and the l favor with which it is received seems to assure the industry nportance in the future.

GENERAL INFORMATION.

TARIFF ACT OF OCTOBER 3, 1913.

* * * stockings, hose and half hose, made on knitting machines or ıposed wholly or in chief value of wool, not specially provided for in this per centum ad valorem; stockings, hose and half hose, selvedged, fashioned, r shaped wholly or in part by knitting machines or frames, or knit by hand, ıch as are commercially known as seamless stockings, hose and half hose, l stockings, hose and half hose * * * all of the above, composed wholly value of wool, if valued at not more than $1.20 per dozen pairs, 30 per valorem; if valued at more than $1.20 per dozen pairs, 40 per centum ad * * *.

DESCRIPTION.

he three classes of hosiery are covered by this paragraph. kings, etc., made on knitting machines or frames," is meant ry that is made by sewing together pieces cut out of long

tubular knitted webs made on large circular knitting machines. Hosiery so made is usually an inferior grade. Occasionally, when special effects, such as stripes, are desired but can not be produced on regular hosiery machines, fabric made in the piece on other machines is cut for hosiery. By "stockings, fashioned," is meant hosiery which is made by stitching together the edges of pieces specially knitted and shaped for stockings on a flat knitting machine or a succession of flat knitting machines. It is called fully fashioned because on the successive machines stitches are dropped or added as required so as to make a stocking that will conform fully to the shape of the leg and foot. By seamless hosiery is meant hosiery made on a circular knitting machine, usually completed with the exception of a short seam at the toe. Full-fashioned hosiery is more elastic and gives a neater fit than the seamless, but the seamless can be made more quickly and cheaply.[1]

The disadvantages of seamless hosiery are less apparent when wool is used than when silk or cotton is the material employed. Wool has greater natural elasticity and wool hosiery is usually ribbed, which so increases this property that even the finest grades of women's wool hose are frequently made on circular machines. Fine light-weight worsted and cashmere are more often full fashioned.

There is a straight-bed machine on which a seamless stocking partially fashioned can be knit. This machine has two straight, parallel rows of needles sufficiently near each other to connect the two rows of knitting at either end, but far enough apart to allow the fabric to pass down between them as it is knitted.[2] Production on this machine is not very rapid, because it is not fully automatic as to yarn changes. This type of machine, which is not essentially a hosiery machine, is more often employed in the manufacture of hosiery made of wool or wool mixtures than of other fibers. This may be because of the fluctuating demand for wool hosiery. Few establishments manufacturing wool goods are equipped with machines on which only hosiery can be made.

DOMESTIC PRODUCTION.

Materials.—Woolen, worsted, cashmere, and merino yarns are the chief materials used in the manufacture of wool hosiery. *Worsted* differs from *woolen* yarns by being spun with more twist from fiber which has been combed as well as carded. Combing removes the shorter fibers and places the remaining long fibers in a more nearly parallel position, producing a yarn with smoother finish. *Cashmeres* are worsted yarns with a woolen finish.[3] They have the smoothness and regularity of worsteds combined with the softness and fullness of woolens. *Merino*, a term well known in the trade, when applied to yarn or manufactures of yarn means a mixture of wool and cotton spun together in the yarn.

Besides the familiar use of cotton and wool in combination, the vogue for fancy hosiery has brought about the introduction of a silk and wool mixture which gives a pleasing effect, not only because of the difference in luster and texture of the materials, but also because of the various color combinations obtainable by dyeing the article

[1] See Survey on Cotton Hosiery for further detail as to kinds of hosiery and processes of manufacture.
[2] Metcalf, M. A.; Knitting, p. 167.
[3] Dept. of Com. Misc. Series No. 32, p. 163.

knitted. Frequently different materials are introticle by plating, a process whereby two yarns are ly in such a manner that one is constantly on the and the other on the reverse.[4] This method is red with yarns of varying quality to produce an appearance at a moderate price, as when cotton and d silk are combined, giving the outside of the garance of being all wool or all silk to a greater extent were mixed in the yarn. Such an article can be ld for much less than one of all silk or all wool. ; may be used to secure effects as well as for purposes requently silk and wool in different colors are so

used mixture of colors in the yarn and not necessarily terials, is used in wool hosiery and in cotton made to

-fifth of the raw wool used by the knit-goods industry ported. In fact, domestic knitters are not dependent for any of these materials, except of course, the raw an wool is said to have a longer, stronger fiber than but it is probable that its peculiar characteristics would ing effect in certain woven goods than in hosiery where yarn is desirable.

—The manufacture of wool hosiery does not require sentially different from that used in making cotton or act, the same machines can be used unless they are of too carry the usually bulkier wool yarn. There is probably lization of wool than of cotton and silk hose because re largely used for sports wear which admits a wider ttern and color. This variation in color, even where sed, is often obtained in dyeing the finished article and, l above, may be dependent upon the use of different that no very great changes are required in the actual cesses. According to the chemical composition the same used to give different shades or, within a limited range, ths may be used resulting in two distinct colors, one on the ther, on the silk.

tion.—The manufacture of wool hosiery is not a separate being carried on by manufacturers of other woolen knit more frequently by manufacturers of other kinds of hosiery. comparatively few mills which manufacture only wool This is very likely the result of greater fluctuations in the or wool hosiery than for that made of cotton and silk.

phical distribution.—Most of the wool hosiery is made in the States. According to the census of 1914, New Hampshire ere are many small mills led, and was followed by Pennsyld Wisconsin. Some wool hosiery is made in practically every gland and Middle Western State.

tic production and consumption.—As indicated above, the dor wool hosiery by the public in general is much more variable demand for cotton or silk. Certain classes of trade require

[4] been much discussion as to the meaning of plating. The following is from "Knitted fabrics" hamberlain and Quilter, authorities on the technique of knitting. "A plated knitted fabric may d with plated metallic goods, and should not be confounded with 'plaiting' or twisting. A ic is composed of two separate yarns one of which appears on the face of the fabric and the other ."

wool hose continually, as workmen who are exposed to the weather and golfers, but beyond these more or less staple types, fad, or fashion governs the demand. At the present time there is a revival of the use of wool hosiery both for men and for women, partly owing to the increase in out-of-door life and the consequent necessity for warmer clothing that will not hamper freedom of movement, partly to the prevalence of sport clothes for street wear, and to some extent to the fashion for wearing low shoes throughout the year.

Production figures are separately stated for wool and merino hosiery, but since one industry produces both, the sum of the two is compared with imports which include hosiery "composed wholly or in chief value of wool." All-wool and merino represented 12 per cent of the total quantity of all kinds of hosiery manufactured in the United States in 1899, 11 per cent in 1904, 8 per cent in 1909, 7 per cent in 1914, and only 6 per cent in 1919. Silk and artificial silk gain in importance at each census. The production of cotton hosiery decreased from 1914 to 1919. The combined production of all-wool and merino hosiery amounted to 5,045,127 dozen pairs in 1914 and to 5,240,000 dozen pairs in 1919, an increase of nearly 4 per cent. The ratio of all-wool to merino hosiery was as 3 to 2 in 1899, but in 1919 it was as 1 to 4. The production of all-wool hosiery has shown an actual as well as a relative decrease at each census since 1904. In merino hosiery, on the other hand, there has been an actual quantitative increase. (Table 6.)

Domestic exports.—Since domestic exports of wool hosiery are not separately stated only incomplete data can be obtained by an examination of import statistics of other countries. Exports of cotton and artificial silk hosiery are widely distributed, no one or two countries taking preponderating quantities. The same is probably true of wool hosiery, though to a somewhat less extent because of climatic limitations. Canada would seem to be our most favorable foreign market, on account of proximity and climate, but wool hosiery is the most important branch of the industry in Great Britain and British goods are accorded a preferential tariff rate in Canada. In 1918 Canada imported a total of wool hosiery valued at $913,643 of which $118,804 came from the United States; in 1920 out of a total importation valued at $1,146,065, the United States supplied $172,943.[5] The largest imports of wool hosiery into Canada from the United States were $225,777 and $327,530 in 1916 and 1917 respectively, when imports from the United Kingdom were smaller than usual. During the war some wool hosiery was sent to the United Kingdom, but the amount dwindled from 96,105 dozen pairs in 1915 to 8 dozen pairs in 1918. French statistics do not show hosiery separately, but wool knit goods other than gloves, fabrics, and ornamented articles imported into France from the United States in 1917 (the last year available), amounted to over 2 million dollars in value. This market also is probably temporary, as total imports into France of this class of goods in 1913 were valued at only a little over $240,000.

FOREIGN PRODUCTION.

The latest Canadian statistics (1919) show that the production of woolen and worsted hosiery amounted to 465,276 dozen pairs, valued

[5] Commerce Reports, Aug. 2, 1920, p. 615.

merino, 485,605 dozen pairs valued at $2,313,672
dozen pairs, valued at $5,552,221. The quantity
s almost 19 per cent less than in 1918. No other

17 dozen pairs, valued at $37,557, were imported by the Government "free of duty."

TARIFF HISTORY.

Wool hose were not mentioned in any tariff act prior to 1913, when rates of 20, 30, and 40 per cent were levied. Under previous acts hosiery was covered by wearing apparel provisions.

The emergency tariff act of May 27, 1921, placed a compensatory duty of 45 cents a pound on all manufactures of wool. Most of the wool hosiery imported was valued at over $1.20 a pound, and therefore paid 40 per cent ad valorem plus the compensatory, which was equivalent to an addition of about 15 per cent ad valorem.

In the act of 1922, paragraph 1114, wool hosiery is divided into two value classifications. Hosiery valued at not over $1.75 per dozen pairs is dutiable at 36 cents per pound and 35 per cent ad valorem; higher priced hosiery is dutiable at 45 cents per pound and 50 per cent ad valorem.

COMPETITIVE CONDITIONS.

Domestic manufacturers, under the tariff of 1913, apparently enjoyed equal opportunity with their foreign competitors in equipment and material. About one-fifth of the wool consumed by the knit-goods industry in 1914 was imported, but this is not necessarily a disadvantage. "The market prices for the raw material (wool) in England and the United States are by virtue of the admission of American buyers into the London market and of the free import of wool into this country on practically the same basis. The American purchaser has something of an advantage in the London market by reason of the exchange situation and has been able at times to outbid his English competitor." [9]

The additional duty on raw wool and wool yarns under the emergency tariff act made the material costs of the American knit goods manufacturer somewhat greater than those of his foreign competitor. This disadvantage was offset in the domestic market by a compensatory duty on wool knit goods, but in export trade it was a definite handicap. The results of the emergency tariff on raw wool, especially of the medium and coarser grades, were not immediately apparent because they were gradual and because large stocks of these wools, which it would take a considerable period to consume, were on hand in May, 1921, when the emergency tariff act was passed.

As regards labor cost and marketing, the benefit probably lies with the European producer. Wages, however, have considerably increased in England, the chief producer of wool hosiery. European manufacturers of wool hosiery have less risk than the American as they can rely upon a steadier market for their output in north European countries, where wool hosiery is more generally and constantly worn.

Although very small amounts of wool knit goods have been imported from Germany in the past, American manufacturers anticipate competition from that source.

[9] A Survey of the British Wool Manufacturing Industry. U. S. Tariff Commission ,1920 ,p. 76.

wool hosiery according to valuations of less pairs and $1.20 or more per dozen pairs under ittle significance, as the rise in prices caused import to be thrown into the higher category. ue of imports in 1920 was $7.97. An incon- ted in the act of 1913, inasmuch as wool provided for" which is actually "cut" hosiery cent ad valorem, whereas the knit fabric from made was dutiable at 35 per cent. COURT AND TREASURY DECISIONS.

Knit woolen hosiery was held dutiable under paragraph 396 of the act of 1890 as wool wearing apparel, and not under paragraph 392 as knit fabrics or fabrics made on knitting machines or frames. (Arnold *v.* United States, 147 U. S., 494.)

The provision in paragraph 285 of the act of 1894 for knit wearing apparel was held more specific than knit fabrics in the act of 1890 or knit goods in the act of 1883 and woolen hosiery was, accordingly, classified under the act of 1894 as knit wearing apparel. (G. A. 3302, T. D. 16657.)

Knitted wool leggings, found to be dealt in the trade as footless golf hose, were held properly classified under the hosiery provision of paragraph 288 of the act of 1913. (Abstract 43007, of 1919.) The court can not take judicial notice that exhibits of wool half hose are not "selvedged, fashioned, narrowed, or shaped wholly or in part by knitting machines or frames, or knit by hand," or "commercially known as seamless," and in the absence of other evidence the collector's classification of them as such under paragraph 288 of the act of 1913 was sustained, overruling the claim that they were dutiable as knit woolen half hose under the same paragraph. (United States *v.* Lee, 9 Ct. Cust. Appls., 111, of 1919.)

Wool hose, clocked, was held dutiable under paragraph 288 of the act of 1913. (Abstract 44468, of 1921.)

WOOL GLOVES AND MITTENS.

General Information.

TARIFF ACT OF OCTOBER 3, 1913.

* * * gloves and mittens, all of the above, composed wholly or in of wool, if valued at not more than $1.20 per dozen pairs, 30 per centum if valued at more than $1.20 per dozen pairs, 40 per centum ad va- * *

DESCRIPTION.

n is a covering for the hand with one sheath for the thumb er for the other four fingers. A glove differs from a mitten ; a separate sheath for each finger. Gloves and mittens ee types, according to method of manufacture: (1) Seam- continuously so that no seams are required in finishing; ned or wrought, knit flat to shape with selvedged edges afterwards sewn together; (3) "cut," made from knitted iout any shape being given in the knitting. Mittens as a eamless; gloves are of all three types.

oves are worn principally for warmth, but for sports wear ped in attractive designs which change from season to fleece-lined cotton gloves and possibly cheap grades of offer some competition to the wool knit glove industry.

DOMESTIC PRODUCTION.

ls.—Wool, worsted, and merino yarn, described in the on wool hosiery, are used in the manufacture of gloves ns.

ent and methods of production.—In the manufacture of mittens cut and sewed to shape ordinary circular or flat are used for making the cloth from which they are cut by the manufacture of gloves from a continuous yarn no machinery is available. One of the best authorities on les of knitting describes the processes as follows: [1]

e consists of three main parts, viz, (1) the cuff or top, nd, (3) the fingers and thumb. *Seamless* gloves are pro- ckly in large numbers by making the rib top and plain matically on a circular rib machine of the superimposed pe, but the fingering has to be effected one finger at a and flat knitting machines, and is a very slow process. oves have all the parts made selvedged to shape on straight ed needle machines, the selvedged edges being finally a cup seaming machine."

tion.—Like wool hosiery, the manufacture of wool gloves is does not represent a specialized branch of the industry. to the Directory of the Knitting Trade it is carried on by concerns which vary from small establishments equipped han a dozen machines to large organizations capitalized to a million dollars, but in almost every instance other goods than gloves are manufactured.

---

and Quilter; Knitted Fabrics, London.

Geographical distribution.—Practically all the wool-glove manufac-
re is located in the Northeast and Middle West. There are more
ncerns in New York than in any other one State, but there are many
d some of the largest in Michigan and Wisconsin.

Domestic production.—The production of wool gloves and mittens
given separately for the first time in 1919, so that it is difficult to
termine the development of the industry. In 1919 the total out-
t of wool gloves and mittens in the United States amounted to
9,984 dozen pairs, valued at $1,235,140.

FOREIGN PRODUCTION.

Great Britain is one of the most important countries in the manu-
cture of all kinds of wool knit goods, the industry centering around
icester, England, and Harwick and Glasgow, Scotland. Gloves
e not separately stated in British statistics, but exports of wool knit
ods other than hosiery amounted to almost $5,000,000 in 1913 and
,500,000 in 1918. Exports of wool gloves from Germany in 1913
nounted to a value of about $700,000, and from France to a value
about $19,000.

IMPORTS.

Imports were not given separately until the second half of the
cal year 1914, when they amounted to 26,127 dozen pairs, valued at
0,343. The largest recorded imports were 204,554 dozen pairs,
lued at $1,492,352, in 1918, the average unit value equaling $7.30.
The average unit value fell to $2.50 for 1921 and to $1.91 for the
st three months of 1922. Imports in 1921 amounted to 121,395
zen pairs, valued at $303,143.

Because of the low unit value of the gloves imported during the
st quarter of 1922, the specific compensatory duty of 45 cents per
und under the emergency tariff act raised the equivalent ad valo-
m duty on the gloves imported during that period by 25 per cent.
Imports come chiefly from the United Kingdom and Germany.

TARIFF HISTORY AND TARIFF CONSIDERATIONS.

Wool gloves and mittens were not specially mentioned in any
riff act prior to 1913, when they were provided for under two
ssifications, those valued at not more than $1.20 per dozen pairs
30 per cent ad valorem, and those valued at more than $1.20 per
zen pairs at 40 per cent. This paragraph (288) provided a less rate
duty (30 per cent) on gloves of the first-named class than on the
it fabric from which they might be made (35 per cent).

Under the emergency tariff act, wool gloves and mittens were sub-
ct to the same compensatory duty as other manufactures of wool,
z, 45 cents per pound.

In the act of 1922, wool gloves and mittens are provided for in
ragraph 1114 under two classifications, those valued at not more
an $1.75 per dozen pairs paying 36 cents a pound and 35 per cent
valorem, and those valued at over $1.75 per dozen pairs paying
cents a pound and 50 per cent ad valorem.

[1] Not specially enumerated prior to 1913.

COURT AND TREASURY DECISIONS.

Under the act of 1883 cashmere gloves made from wool knit goods upon frames or cut into shape and sewed together, were held to be dutiable as knit goods under paragraph 363 at 35 cents per pound and 40 per cent ad valorem, and not as wearing apparel other than knit goods at 35 per cent ad valorem under paragraph 366 of that act. (G. A. 56, T. D. 10335, of 1890.)

Under the act of 1894 men's cashmere gloves, not knit into form but cut and fashioned from a knit fabric similar to Jersey cloth, were held dutiable as knit wearing apparel under paragraph 285 rather than as wool wearing apparel under paragraph 284 of that act. The court said the term "knit wearing apparel" in paragraph 285 was not limited in its application to articles fashioned in the process of knitting, but included all articles of wearing apparel made of a knitted and not of a woven fabric. (G. A. 3255, T. D. 16537, of 1895.)

WOOL KNITTED ARTICLES.

GENERAL INFORMATION.

TARIFF ACT OF OCTOBER 3, 1913.

*, and knitted articles of every description made up or manufactured
t, and not specially provided for in this section, composed wholly or
wool, 35 per centum ad valorem.

DESCRIPTION.

ed articles provided for in paragraph 291 of the 1913
luded all wool knit goods except knit fabrics, hosiery,
which were enumerated in paragraph 288, and shawls,
ıentioned in paragraph 291 but statistics for which have
ed with woven shawls. This description would there-
l other wool knit wearing apparel which comprises two
ches of the knit goods industry, viz, the manufacture of
nd the manufacture of outerwear or fancy knit goods,
ıters, toques, scarfs, and bathing suits.

DOMESTIC PRODUCTION.

—The description of materials used for wool hosiery and
, fabrics applies also to these branches of the industry.
yarn used in this fancy knit goods industry ranges in
3's to 2/80; the wool from 8's to 2/23, and the merino
/23. Besides these yarns there is a considerable amount
eaver, and llama hair used.
.—Most of the underwear made in the United States is
tubular fabric knit on circular machines—that of fine
spring-beard machines, and the coarse, on latch-needle
Practically all machinery of this character is made in
States and some of the most important developments,
stop motion which automatically ceases the operation of
after yarn breakage, are products of American ingenuity.
ımber of foreign-built machines, however, are used in the
ıdustry. Domestic builders supply most of the circular
ıt the flat machines probably to the extent of 80 per cent
d. The reasons given for the more extensive use of
machines are that they permit a wider variety of pro-
l in general stand service better than the American
Germany and England are the most important builders
y of this type and manufacturers of fancy knit goods,
Germany, probably have some advantage in obtaining

ısion of the industry in the United States since 1914 has
approximately a 50 per cent increase in the use of circular
d a 25 per cent increase in the use of flat machines. This
ıvolved a much heavier expenditure for plant construc-
uipment than would have been necessary in 1914. It is
ıat the average increase in the cost of knitting machinery
o 1920 was 150 per cent. New equipment in this line is
mous with better machinery, for there have been no
ıts of importance since 1914 except the three-thread

atic striper on circular machines, which increases output and s labor costs, but the application of which is of course limited. uipment of German mills, even if not replaced since 1914, will out of date.

hods of production.—In the underwear industry the methods duction are similar to those employed in the manufacture ton underwear discussed in the survey on paragraph 261 tariff act of 1913. In the manufacture of outerwear and knit goods, standardization is extremely difficult because variety of the product and the change in style from season son. This, of course, limits the use of fully automatic nery. The skill of the knitter plays an important part in ish and appearance of the garment and, generally speaking, epresents a larger proportion of the total cost in this branch industry. The greater part of the machines in use are power , but some small concerns still use hand machines on which a of articles may be made. Where the machines are large and te and the work heavy, the knitters are usually men, but female s well adapted to knitting and the number of women in this tion is increasing. In the Cleveland district about 75 per cent machinery in the fancy knit goods industry is run by men and cent by women. In the East men operate about 90 per cent full-fashion machines but only about 50 per cent of the circular nes, but as only about 15 per cent of the industry is full- ned, the remaining 85 per cent, comprising articles cut from usually knitted on circular machines, the proportion of women industry as a whole more nearly approaches the ratio given cular machines than that for full-fashion machines. Women n most of the finishing operations which usually involve the use e form of sewing machines. All of the processes require from months to a year for the worker to become skilled. The Na- Association of the Sweater and Knitted Textile Industry esti- the proportion of direct labor in the manufacture of sweaters per cent in 1914 and 37.2 in 1920.

nization.—Although a few very large mills are engaged in the g of outerwear and fancy knit goods, there are a great number of concerns in the industry, a fact explained by the National ation of the Sweater and Knitted Textile Industry [1] as follows:

> nitted outerwear industry in the beginning was confined to a large extent to types of garments, which were very readily made on simple equipment; he ease with which a skilled knitter could enter the business by buying a achine or two, plus sewing machines, and become what is known in the trade as a "kitchen knitter." However, as the business has developed in extent iety, the proportion of small plants is constantly decreasing, owing to the ncreased capital investment necessary as well as the greatly increased working required to produce the trade requirements in knitted outerwear. When a oncern has made any appreciable success it has come through specializing on a very small assortment and making quick turnovers. Frequently no osts are ascertained, hence the large proportion of failures among this group of cturers, especially in times of even moderate recessions in demand.

raphical distribution.—The wool underwear industry is pretty ntralized in New York State, especially at Cohoes, and in New nd. The outerwear and fancy knit goods industry is probably ost widely distributed branch being practically the only one many mills in the far Western States. The principal centers,

[1] e National Knitted Outerwear Association.

Brooklyn, New York City, Cleveland, Philadelphia, and

l value of production.—In 1914 the domestic production of
derwear amounted to 373,045 dozen shirts and drawers,
,448,575, and 147,221 dozen combination suits, valued
5; merino underwear amounted to 1,434,504 dozen
rawers, valued at $9,228,686, and 486,128 dozen com-
s, valued at $5,706,102, making a total valuation of
for wool and part wool underwear produced in 1914.
nted an increase in the production of all-wool under-
per cent over 1909 and a decrease of 30 per cent in
rwear.

ction of outerwear and fancy knit goods is not given
s reports by materials of which composed, and in fact
itself is not so divided. Many articles are composed
vool or of either of these materials and cotton, or gar-
ferent fibers are produced simultaneously in a mill so
tput of any one kind is not recorded separately. In
sus shows a production of all descriptions of "sweaters,
kets, etc." amounting to 2,249,142 dozen, valued at
This is an increase of 1.25 per cent in quantity and
nt in value over 1909; but the increase from 1904 to
uch more marked, amounting to 173.70 per cent in
l 168.78 per cent in value.

ipal items listed in the census which would fall under
ation are (1) cardigan jackets, sweaters, etc., (2)
s, etc., (3) other fancy knit goods, (4) bathing suits,
The total value of these classifications amounted to
in 1914, which was an increase of 24.66 per cent over
on of similar items in 1909. The census of 1914 gives
silk knit articles corresponding to these classifications
nted to $1,182,510. Deducting this from the above
ue of $34,013,638 for the production of these articles
l and cotton. It is impossible to ascertain the propor-
of these materials, but considering the nature of the
robable that by far the larger part of the value repre-
nit articles.

FOREIGN PRODUCTION.

ain has long been considered the most important pro-
l knit goods, but although no authoritative statistics of
re available, it is somewhat doubtful whether or not the
n the cotton knit goods industry in England will not have
fect upon the manufacture of wool knit goods. Some mills
rly made wool goods may now be devoted to cotton
ster in England and Glasgow and Harwick in Scotland,
l remain important centers of the wool knit goods indus-
ny is probably not far behind Great Britain in normal
oducer of wool knit goods, as her exports of such articles
ible. Switzerland during the war obtained some portion
n trade, in fact it is said that a large part of the expan-
wiss industry is the result of the removal of German con-
ntral territory. French manufacturers have more consist-
l their efforts to the development of silk knit goods, so

ued at more than $2 per pound	45 cents per pound and 50 per cent ad valorem.

Act of 1897, par. 357. [2] Act of 1909, par. 369.

Court and Treasury Decisions.

Wool wearing apparel in part of braid, ornaments, or trimmings, have been held more specifically provided for as wool wearing apparel under this paragraph than as articles in part of braid, etc., under paragraph 358 as follows: Coats, vests, trousers, etc., in part of braid (G. A. 7597, T. D. 34755, of 1914; Abstract 37356, of 1915; and Abstract 38912, of 1915); and women's jackets and other wearing apparel (Abstract 38636 and 38718, of 1915); knitted wool caps, ornamented with rosettes composed of silk ribbon (T. D. 34985, of 1914); woolen costumes, in part of braid or silk and fur trimming (Abstract 37223, of 1915); women's jackets (Abstract 38636, of 1915); fringed hoods (Abstract 38922, of 1915); shawls, knitted or woven of wool and not made in imitation of lace (Abstract 45010, of 1922). These rulings are in accordance with the principle laid down in United States *v.* Snows U. S. Sample Exp. Co. (6 Ct. Cust. Appls., 120, of 1915) relative to shirt bosoms of tucked cotton material.

Slippers, where the cattle-hair and wool components together would be of greater value than the leather component, are not to be classified as wool chief value by treating the cattle hair as wool by construction and adding it to the wool component, but the three single components must be separated. The articles were held classable as in chief value of leather. (G. A. 7939, T. D. 36582, of 1916.) Slippers containing wool not exceeding 2 per cent (Abstract 30702, T. D. 33018, of 1912).

Under the act of 1909 the following articles were held dutiable as ready-made clothing or wearing apparel, including shawls, wholly or in part of wool: Cosmanos, consisting of small head shawls, composed entirely of wool (Abstract 37618, of 1915); hair rolls or "rats" in part of wool (G. A. 7173, T. D. 31315, of 1911); Russian tunics composed of cotton and trimmed with wool (Abstract 31178, T. D. 33145, of 1913); silk hats in part of wool (T. D. 33008, of 1912; G. A. 7578, T. D. 34600, of 1914); boys' suits in chief value of cotton and in part of wool (5 Ct. Cust. Appls., 261, of 1914).
